A McGRAW-HILL PUBLICATION

50 CENTS

FOR VICTORY AT SEA

Should the need arise again, the Cougar II jet fighters above, plus the new Grumman Tiger, will play as big a role in victory as did Panther jets in Korea . . . as did Grumman Wildcats, Hellcats and Avengers of task force fame in World War II.

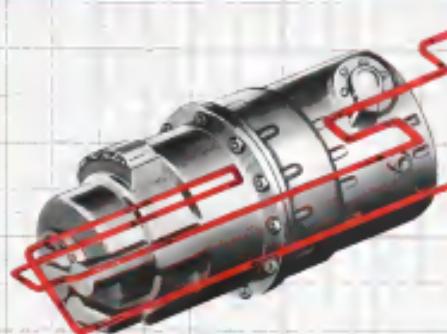

GRUMMAN AIRCRAFT ENGINEERING CORPORATION

First in Constant Speed Drives...

SUNDSTRAND

Sundstrand Drives help end alternator environment problems

That a 40 pound generator spins like ice can be environment free! You can overcome present electrical system limitations on aircraft speed and altitude by solving problems of cooling, lubricating, and wear in the alternator.

Aerospace manufacturers, making it in cooperation with Sundstrand, have made possible the advanced development. The Sundstrand Drive links engine and alternator mechanically and hydraulically. Result of a unique oil system, cool and lubricate the totally enclosed alternator - making a environment-free, oil-free by durable, efficient, inexpensive, long-life drive.

Using several lines to both drive and eliminate wear on conventional aircraft weight, space, and maintenance, Sundstrand's close co-operation with engine and alternator manufacturers pays off with constantly improved aircraft power systems. Write us about your problem!

Another hurdle to higher,
faster flights has been
overcome, thanks to
co-operation between
America's talented
aircraft engineers.

RESEARCH LEADS B.F. GOODRICH PART IN RUBBER

B.F. Goodrich

PART IN RUBBER

New B. F. Goodrich tire is Dimpled for more landings, Tubeless for less weight

THE B. F. GOODRICH Dimpled T-1000 Tire combines the most advanced tread design with the most advanced tire construction. It reduces wear an average of 15%. By eliminating the tube, it reduces tire weight by as much as 75%.

The most important comparison, though, is the B. F. Goodrich Dimpled tire increases tire landing loads by a substantial margin. Reasons? It is better proportioned, gives more rolling contact, because dimple-like indentations assist in better road load distribution. Wear is slower, more even. The tread also has a broader footprint to wear is spread more evenly from shoulder to shoulder. Result: more landings before replacing.

Furthermore, B. F. Goodrich T-1000

Tires make greater pay loads possible. On United's DC-80, three, 100G tubeless Tires reduce weight approximately 40 pounds under regular tires and tubes. These tires save time and money in warehousing and maintenance, too. Lessened cost of air and tube, there's only the tire to purchase and stock - only the tire to mount and service.

As in B. F. Goodrich T-1000 Tire can, added safety is achieved by eliminating the inner tube. There's no tube to burst or leak. No tube to burst or shift during take-offs or landings. A punctured outer tire, itself as an integral part of the tire itself, replaces the conventional tube and reduces contact in-

tion pressure much longer.

The new Dimpled T-1000 Tire is another example of B. F. Goodrich leadership. The B. F. Goodrich Company, Tire and Equipment Division, Cincinnati, Ohio. Above: One

Product of B. F. Goodrich leadership is unsurpassed research and engineering. Now, wheels and tires. B. F. Goodrich's tire line - Medical rubber • Aircraft tire line • T-1000 tire • Premium tire line • Heavy-duty, flat-free, maintenance

Wheels, aircraft, maintenance

NEWS DIGEST

Domestic

Pozzetti Helicopter Corp., based in a new plant because of the recent resignation of head chairman Frank Pusella announced today that it has formed one—the Verplastic Corp. The Marion, Pa., firm's board of directors also called for a special meeting of stockholders for Oct. 27 to approve the change. Stockholders will be called at the same time to approve the addition of two members to the present 13-man board—Thomas K. Pindelitz, former Secretary of the Air Force and John F. Pindelitz, former Assistant Secretary of Navy for Air. Frank Pusella has founded a new company of his own which is known as the Pusella Aircraft Corp.

First nonstop scheduled transatlantic flight from New York to Los Angeles at 881 miles was first nonstop by Trans World Airlines. Sigma Corporation on Sept. 26. Service is transatlantic forest fire fleet. TWA is scheduling nine nonstop and nine nonstop nonstop flights on transatlantic routes.

Nuclear Development Corp. of America will build a nuclear "central" facility at its Nuclear Experimental Station in Dutchess County, N. Y., to study the effects of structural components on reactor internal parts, effects of various fuels and to determine the best operating conditions for various reactor systems. Work on the \$400,000-plus facility will begin in late fall.

New record land speed of 1,230 mph has been set at 1,230 mph was recorded over the 1-km improved test track of the Naval Ordnance Test Station, China Lake, Calif. Previous record for an unassisted land-set on the 10,000-ft. track at Edwards AFB was this record 1,160 mph. New work was made during a surface test, to Navy scientist W. D. Denosier.

Henry E. Strakla, 41, manager of American Airlines' news service and editor of *Flagship News*, died Sept. 26th after a long illness.

Financial

Flying Tiger Line reports sharp gains in earnings, but net income of its 1954-1955 financial year ending June 30, the carrier showed a \$400,115 net

McDonnell Convertiplane Exceeds 180 mph.

McDonnell XV-1 convertiplane has been clocked at over 180 mph, breaking the previous record for helicopter-type aircraft of 156 mph, recorded by turbine-powered Sikorsky CH-39. The mark was set on the XV-1's initial flight April 29th at St. Louis Field, St. Louis, Mo. The XV-1 has been developed for the Army by USM's Air Research and Development Command. The nose down a variation in the landing after the nose pitch, which appears to bring slightly compressed with the nose pitch of the frame shown in initial phase.

success as compared with a loss of \$435,545 the previous year. Profit was earned despite a decline in gross operating income from \$13,642,919 to \$13,501,289. Major factor in the gain has been heavier contract operations since the Korean war, with revenues rising about \$1.5 million annually.

Delta Air Lines, Inc., formerly known as Delta-Cities Air Lines, has called for ratification of its \$2,573,100 net share of its 15% convertible debentures (underwritten) on Oct. 27. That year the airline has called a total of \$3,037,100 in debentures due May 1, 1971, since raising \$1,000 in debentures due December 31, 1968, at the time the two firms merged May 1, 1955.

Delta Air Lines, Inc., formerly known as Delta-Cities Air Lines, has called for ratification of its \$2,573,100 net share of its 15% convertible debentures (underwritten) on Oct. 27. That year the airline has called a total of \$3,037,100 in debentures due May 1, 1971, since raising \$1,000 in debentures due December 31, 1968, at the time the two firms merged May 1, 1955.

Republic Aviation Corp. has declared a 10-cent dividend on common stock payable Oct. 23 in liquidation of record Oct. 7.

National Airlines reports \$3,697,775 net profit for its 1955 fiscal year ended June 30, on operating revenues of \$16,668, highest in the airline's 22 years. NAL has finalized a regular 24-craft aircraft dividend payable Oct. 24 to holders as of Oct. 4.

International

Pan American World Airways' seventh cargo traffic increased by 59% during the first few weeks of its new service from Atlantic rates. During the period—Aug. 15 Sept. 17—the carrier

handed 687,569 lbs of freight. The airline is adding a sixth all-cargo flight to its schedule to handle increased business.

Proposed to purchase Folland Gnat light fighter in India at the government's Directorate Aircraft Factory, is being studied by Indian officials.

International air traffic tonnage settled through the IATA Clearing House, London, increased by 25% during the first half of this year, as compared with the same period in 1954. Total tonnage was 174,663,000 in 1954, while with 117 Airlines Clearing House settled 189,210 in first half of 1955, a 15% increase over same period last year.

Belgian Overseas Airlines Corp. will equip its 14 Douglas DC-7Cs on order with cargo carrying units made by the Rohr Corporation of America.

Projections of three percent will be given next week to 3,000 officer and design aviation of Avco Aircraft, Ltd., and Canadair, Englewood, Ont., Canada, respectively to May 1 under a new cargo contract signed with AFL Mackay. Under New contract does not affect the firm's 11,000 production workers.

Three Vickers Viscount 80s have been ordered by Fred Olsen Air Transport Ltd., Norway, bringing total orders for 800-seater Viscounts to 16 and total Viscount (all series) orders to 239.

The power is at your disposal from static to supersonic flight. We produced almost daily changes in aircraft technology. The Avi-Borne products developed were all original in that time—and are constantly being improved to keep abreast of these changes. Since we now produce we constantly being developed, too. If any of these areas your requirements, we can design one that does—and we want to. Write for our new Avi-Borne Catalog today.

AVIATION CALENDAR

Oct 7-Europe from High Performance Aircraft Sessions, sponsored by Institute of Transportation & Traffic Engineering, at U.C.L.A., Aerospace Engineering Area, Los Angeles, California, Los Angeles, Calif.

Oct 13-14-National Association of State Aviation Officials, annual convention, Dallas.

Oct 14-15-Society of Automotive Engineers, Golden Anniversary Aerospace Materials, Electronic Products, and Aircraft Engineering Division, Hotel Statler, Los Angeles.

Oct 17-21-National Metal Exposition, Commerce Hall, Philadelphia.

Oct 17-20-National Safety Council, 41st Annual Convocation, Exposition, La Salle Hotel, and Hilton Hotels, Chicago.

Oct 17-23-International Air Transport Assn., 11th annual general meeting, Waldorf Astoria Hotel, New York.

Oct 18-Midwesters, Second Aviation Conference, Fairmont, Mass.

Oct 19-20-International Award Display and Selection Committee, announced by the Washington State Agricultural Council and the State College of Washington, Pullman, Wash.

Oct 20-21-50th annual National Space Association Annual Research Conference, Cleveland.

Oct 24-25-International, of Radio Engineers Professional Group on Electronic Devices, first annual Technical Meeting, Washington Hotel, Washington, D.C.

Oct. 25-27-Twelfth Conference on Air and Earth Propulsion, Aerospace Institute of America, Hotel Hollywood, Hollywood Hills Hotel, Los Angeles.

Oct 25-26-Subsidiaries Export Managers Assn., annual meeting, Griffiths, C.C., Oct. 27-28-American Electrical Society, 12th annual meeting, Pacific Auditorium, Los Angeles.

Oct 28-30-Second Annual Ingels Aviation Day, Toyota, Calif.

Oct. 31-Nov. 1-Institute of Radio Engineers, 1975 East Coast Conference on Antennas and Propagation, Electronic and Electrical Engineers, Hotel Roosevelt, New York.

Oct. 31-Nov. 2-Society of Automotive Engineers, Golden Anniversary Transport Meeting, Chateau Hotel St. Louis, Mo.

Nov. 2-4-Society of Automotive Engineers, Detroit, Edison Meeting, Chateau Hotel St. Louis, Mo.

Nov. 3-4-Institute of the Aerospace Sciences and Canadian Aerospace Institute, second annual joint meeting, Clinton Lagoon, Ontario, Ont.—Crown Inn, #18—National Aviation Trade Assn., annual meeting, Hotel Wawona, Big Bear Lake, Calif.

Nov. 9-10-Society of Automotive Engineers, Golden Anniversary Fach & Labora-tories Meeting, Bellview Sheraton Hotel, Philadelphia.

Nov. 11-13-Industrial Management Society, 5th annual meeting, motor industry management week, Hotel Sherman, Chicago.

WALTER M. TURPIN
Vice President
AIRCRAFT
PRODUCTS CO.

"Aircraft Products Company has used the facilities and services of AETCO to the extent to a significant degree in the development of experimental and qualification testing of Aircraft Hydraulics Components."

"In the case of one of our projected AN Standard valves on which development and experimental testing had been completed, it was determined that AETCO was required to perform the qualification testing in order to reduce our own laboratory to a minimum."

"The qualification testing performed was completely satisfactory. The work was done promptly and accurately in accordance with our requirements. The accuracy of the required results had been proven by later field experience on production units."

"AETCO was chosen by our engineers for this important work on the basis of previous test work conducted satisfactorily by them."

"We feel that the same importance should be given to the aircraft engineer in the selection of a test facility in order to be dependent in the use of the products on the aircraft. The test facilities of AETCO have certainly been a factor in our selection of them to carry on the work."

"The adequacy of shop equipment and shop line strength determines in the Aircraft Testing Field, we feel, are other qualifying factors."

WHO'S WHERE

In the Front Office

G. Lester Johnson, president of Gator Marine Corp., subsidiary of Gator Rydzik, Inc.; Edward M. Goss, president of Gator Hydraulics, named chairman of the board of Gator Marine.

James W. Clegg, president of Cooper with Stahl Co.; Frank R. Saylor, elected chairman of the board of directors; Henry G. Hyler elected honorary chairman of the board and chairman of the honor committee.

William H. Schlesier, vice president in charge of Service Division.

C. George Danziger, vice president in charge of Service Division.

Ralph C. Moffat, assistant vice president in publishing division of United States Steel Corp.

Col. R. L. Anderson, assigned as vice president of Photogen Air Lines to become vice president of Searles & Co. Shultz will continue as a member of the board of directors of PMA.

Prize R. Shuster, vice president business Tropic Industries, Inc., announced vice president, General Marine Company.

C. L. Prather, vice president-general manager of Brown Instruments Div., Major Appliance Honeywell Regulator Co.

Donald C. Balmer, controller of Bond Electronics Co., Inc.

R. W. Morris and George C. Neal elected directors of Eastern Air Freight Corp. Lorraine P. Rockwell elected director of the board of directors of Dixie Maritime Chemical Corp.

Honors and Elections

Edward F. Schausman, president of Super Electric Manufacturing Co., Paterson, N.J., named recipient of 1965 Air Force Topflight Award, given by the National Air Force Association, Nov. 13, Wright Wing.

John Peter and C. L. Pray, Jr., of United States Steel, will be presented the 1965 Major Award, given by the Society of Automotive Engineers, Aerospace Meeting, Oct. 10-15, in Los Angeles.

Richard E. Fisher, Veterans Affairs, named Chairman of the Air Transport Association's Public Affairs Committee.

Changes

John R. Wiles, aviation director of The Port of New York, Anthony Marshall B. Rockwood, acting director of aviation Affairs, Airline Division, manager of airlines research and development of Convair, Port of New York.

William Trull, technical sales director of Miles Lake Sales, Dallas.

William H. Oestell, Jr., assistant sales manager of U.S. Steel Aircraft Corp., Miami, Fla.

Robert B. Clegg, marketing manager of M. M. Hirsch Co., Morris Group, 911 S. Figueroa St., Los Angeles, Calif., 90017, 213-623-1500, D.C. office, Los Angeles, Calif. (Continued on page 113)

INDUSTRY OBSERVER

► General Electric's L-199 engine is scheduled for two forthcoming North American Aviation designs. These are the long range intercontinental and light-tourism aircraft for which North American recently was awarded Phase I contracts.

► Navy plans to equip a light carrier with the Talos surface-to-surface guided missile. Talos has a longer range than the Corair Turner now installed on the Navy's fast attack carriers, Bonita and Corvair. The Talos is being manufactured by Bendix Aviation Corp. with the power plant by McDonnell Aircraft Corp. and guidance system by Roto Corp. of America.

► Convair officials have recently reported that the F-102A, supersonic USAF fighter currently in production, will be 90% built through subcontract.

► Northwest Airlines has purchased a GE/Elta Quadratic ground control approach set for installation at Shreveport in the Allouette along its Great Circle Route to Japan. Northwest is resuming the Shreveport refueling base, formerly operated in USAF, to shorten its North Pacific Route to Tokyo. Northwest will use Transversing AFB in Cold Bay, Alaska, as its shipping point.

► Royal Air Force is reconsidering its order for Vickers V.1000 jet transports powered by the Rolls-Royce Conway turbines engine. RAF is budget financing to construct its first two combat-type aircraft. British government officials may take over the V.1000 development when it has been put into production. Prototype V.1000 is now nearing completion at Vickers Weybridge plant.

► North American Aviation's F-107, designed for Mach 2 speeds will be powered by a Pratt and Whitney J57 engine.

► Convair Corp. delivered its first FIFI-1 precision missile (AW Mar. 26, p. 58) to the Navy on schedule and before regular production aircraft were delivered.

► North American's recently visited Germany to interview both German manufacturers and the new Germans as well as their light-weight delta fighter design.

► Bell Aircraft Corp. experimental VTOIL has made 20 vertical flights, eight horizontal flights and one through complete transition. Bell test pilot Don Huie has made all of the VTOIL flights.

► Sale of Canadian Corp. Ltd., Montreal, and Fort William, to A. V. Roe (Canada) Ltd., Toronto appears made, with 87% of the shares of Canadian Corp. & Foundry having been deposited for sale to A. V. Roe (Canada) Ltd., at \$30 a share. Canadian Corp. & Foundry, the subcontractor for the Grumman S-2F anti-submarine aircraft being built by de Havilland Aircraft of Canada, Toronto, for the Royal Canadian Navy, and also the Royal Canadian Air Force. The company also builds boats, nuclear reactor, and other heavy industrial items. A. V. Roe (Canada) Ltd. is expanding its operations which now include Avco Aerospace Ltd., Canadian Steel Implementers Ltd., all of Toronto.

► Defense awards to small business firms increased 34% during July over the same month last year. The small firms received in July a total of \$304 million in contracts, net value of all defense procurement was reported at \$639 million.

► The supersonic Convair XFYU-1 Navy fighter is equipped with a Messier ram air emergency power package (AW Apr. 25, p. 53). The unit supplies sufficient electrical and hydraulic power to maintain flight control and communications in the event of an in-flight emergency such as a failure of the main alternator.

AVIATION WEEK, October 3, 1965

AUTOMATIC ... pinpoints type and location of all kinds of errors...automatically.

VERSATILE ... tests any wiring system...or panel assembly without modification.

UNIVERSAL ... tests for all types of errors resulting from incorrect connections, short resistances, and insulation resistances.

SIMPLE ... ordinary, non-technical personnel can master its operation in thirty minutes or less.

ACCURATE ... detects and measures resistance impossible to find with most equipment.

FAST ... checks results in 1/10 second each. Makes tests in minutes which once required hours.

Model 30 DIT-MCO Automatic Electrical Circuit Analyzer
Digital Circuit Analyzer
The machine will test 800 circuits in 8 seconds

NOW! A High-Speed Circuit Analyzer So Accurate It Can Detect Continuity Resistance Down to 1/10th ohm!

DIT-MCO Automatic Electrical Circuit Analyzers

Save Time and Money in Production, Maintenance and Overhaul of Aircraft, Guided Missiles, Telephones Systems, Computers and Radar ... Wherever Complex, Multiple Circuitry is Used!

Here is the first and unique test system to provide the production and maintenance methods of testing and analyzing complex, multiple circuitry. The DIT-MCO Automatic Electrical Circuit Analyzer makes off-the-shelf testing methods obsolete.

Where present hand and machine testers are laborious and unsimplified, the DIT-MCO Analyzer is fast and simple. 100 circuits' explosive multiple short circuits are easily detected in the first few seconds of testing on a front control panel, and as quickly as the machine can be re-set.

The DIT-MCO is wonderfully sensitive. It can be tested from one circuit testing point to another without reconnection. It provides for one test line, the opposite test line, and a ground line. It can be used to test for short circuits, open circuits, and for changes in line to test any electrical article in any stage of production, final fixtures, or installations. This article includes electric automobile interiors, in vehicles made by many auto makers, as a common point of a network, such as a power line, the circuit to a radio, the circuit to a television, the circuit to a telephone, the circuit to the seat, and the radio will automatically test the new arrangement. The analyzer can automatically and instantaneously tell the radio, television, telephone, heating, air conditioning, car, television, radio, telephone, lights, or fixtures, the DIT-MCO Analyzer defines these areas with absolute accuracy.

Continuity is easily checked with the test equipment in the order of reading. By automatically connecting to one point of contacts in 2 seconds, leakage resistance is checked, and the time of reading any article to 800 circuits on a circuit board. These values are off-the-shelf.

In some areas, such as aircraft, and its ability to make this measurement, the DIT-MCO Circuit Analyzer is a rugged, practically bullet-proof machine. In measurement ports are the same as those used for aircraft as avionic telephone systems, and most article are off-the-shelf. In the field of aircraft, the DIT-MCO has been used to measure the life of 100,000 hours with no breakdowns of all.

The tremendous speed and accuracy of this machine plus its reliability and economy to test all kinds of articles, make it a "must" for companies which manufacture, assemble, or repair electronic equipment. The DIT-MCO Analyzer, Model 300, can be built in test ID to 200 circuits with multiple stations to provide as much as 1000 circuit capacity.

Write today for full details, and arrange for a free demonstration in your plant.

Washington Roundup

Air Force Expansion

The Air Force campaign to expand its pool of 137 wings around the country when Gen. Thomas D. White, USAF Vice Chief of Staff, said that it's high and time to necessary to match Russian airpower at present.

This followed a low established by USAF Chief of Staff Gen. Norton F. Twining when he told the Air Force Association in August, "We all know that a 137 wing Air Force is not a permanent solution to meet air power needs."

White told a meeting of business leaders in the Pentagon that if the Soviet Union continues to make gains in quality, the US must have to think more about matching their capacity. He said that while the Soviet Union has been the main concern, recent reports that the United States' American aircraft are aging. But he warned that if Russia cannot continue to expand, we may have to think of matching their numbers.

Hanaman to Depart?

Watch for R. Earl Hanaman to quietly depart from his Pentagon command post before the year's end and return to his former job at Bell Laboratories.

MG-13 for Egypt?

Reports that 100 MG-13 fighters are involved in the arms purchase deal between Egypt and Czechoslovakia added fuel to the British and American governments which are strongly concerned over continuing a liaison between the Soviet and Egyptian forces.

The MG-13, which is similar to the Czechoslovak MiG-15 fighter and in both air forces, would give Egypt an overwhelming superiority advantage.

In Washington, the State Department said it was "highly doubtful" that Israel would be permitted to purchase American fighters such as the North American F-86 Sabre, to assist the Egyptian war with western arms firms.

Chairman and the deal was made between Egypt and Czechoslovak because the Red will offend air financing terms, including a lame deal for Egyptian cotton to be charged for the arms.

Congressionel Airline Studies

Members of the House Committee are pushing the plan to stock air transportation during the congressional recess.

Those members of the committee are going to Mead to attend a regional conference of the International Civil Aviation Organization on "The Facilitation of Air Travel." This is Rep. Thelbert MacDonald (D-Minn.), Rep. Don Hayworth (D-Mich.), and Rep. John Bunker (R-Ia.).

Other members of the committee are traveling to Europe, via the Polar route of Scandinavian Airlines System, to discuss jet and local service with officials of British, French and Scandinavian experts. On the other hand, the main purpose of the trip was to attend the ICAO meeting at the Hague, and this concluded before the recess. Then the U.S. delegation to the European trip is Rep. Otto Gruen (D-Ala.), Rep. Charles W. Wynn (D-N.J.), Rep. John Williams (D-Mich.), Rep. Joseph O'Halloran (R-N.Y.), Rep. Peter Mack (D-N.J.), Rep. Leslie Del-

inger (D-N.Y.), Rep. George Mortler (D-N.Y.), Rep. Steven Diamond (D-N.Y.), and Rep. Walter Rogen (D-Tex.).

Big Defense Contractors

The Senate Preparedness Investigating Subcommittee, headed by Sen. Lyndon Johnson (D-Tex.), will receive a series of reports starting this week, dealing with the 100 largest contractors for the Department of Defense, of which air aircraft is related manufacturers. Later reports will analyze the volume of business that has gone to specific segments of defense contractors.

Democrats on Defense

A group of points Democrats will then be challenging the Air Force's defense policies was given by Sen. Stuart Symington (D-Mo.).

- A slowdown in the next Congress on the relative U.S. Soviet air strength will conclude that the Department of Defense has presented an optimum picture without basis in fact.

- There has been no necessary, except in defense, Syringa projects that since 1953 the Administration has made cuts of \$1 billion in defense, but increased other government expenditures almost \$1 billion.
- Disarmament hopes of the world lie in U.S. military strength, since Reds respect power-and power only.

CAB Protests

Civil Airlines Board has vigorously protested the project that makes it put as much cash to compete with other forms of transportation. CAB's Chairman Carl Studds expressed concern that the flight below average legislation proposed by the Cabinet Committee on Transportation in a letter to Sen. Warren Magnuson (D-Wash.), chairman of the Senate Committee on Commerce. It goals strengthens the emphasis on competition in transportation policy.

"We do have an air transportation a large number of domestic trans-continental routes which are very well developed and which we believe are capable of meeting any new services which other forms of transportation rate," Studds declared. "On the other hand, in the field of local routes and intrastate transportation there are segments that could not be filled by domestic air rates. Any new services that could be made available, such as those being considered, directly or indirectly, may bring about an overall cost reduction which would damage them further than we still in need of substantial subsidy from the federal government."

British Reprisal?

Great Britain is preparing a set of special conditions in U.S. built commercial aircraft imported by the British. The requirements are reportedly similar to that proposed by the British Vickers Vulture by the Civil Aviation Administration, although Great Britain does not concur with them.

Discussions have been held, but no details of the conditions have been revealed. The requirements will apply to piston engine aircraft but not to jets. The British advised the U.S. to come back for more information of an American firm still a jet designer to a British customer.

—Washington staff

Navy Aircraft Buying Faces Investigation

F3H-1 contract touches off Senate, House inquiries; Congress inclined to place blame with Navy.

By Katherine Johnson

Washington—Two congressional investigations have been started into the aircraft procurement policies of the Navy over the past few years resulting in contract cancellation of more than \$1 billion and costing the government several hundred million dollars in termination charges.

Both investigations—the most recent was begun last week—were started because of the Navy's program for the McDonnell F3H-1.

Under the program, the Navy is paying more than \$67 million for 50 aircraft, costing approximately \$1,318,000 each, including options, which will be used primarily for the ground training of mechanics. The planes, powered by a 7,000-lb. Westinghouse J40 engine, were originally ordered as all-weather carrier-based fighters.

The investigation is being made by the Senate Hearings investigating Subcommittee, headed by Sen. Linus Johnson (D-Tex.), and by the House Military Operations Subcommittee, headed by Rep. Chet Holifield (D-Calif.). Both Senate and congressional investigations were started by the Senate Armed Services Committee (SAC) because Secretary of the Air Force, The House committee was headed by Rep. Frank Kasten (D-Md.).

Focus on F3H-1

Here are the facts on the F3H-1:

- Of the 56 F3H-1 planes ordered by the Navy, six crashed in tests, killing two pilots. Five of the crashes were in the St. Louis area.
- Of the remaining 50 aircraft, the Navy has decided that 21, costing \$25,350,000, can be used only for ground training of mechanics or research into structural stress resulting from instrument failure. These were the first F3H-1s off the production line. The cost of conversion of the aircraft for main combat missions would be prohibitive according to the Navy.

- Twenty-nine of the F3H-1s will be converted for installation of 16,000-lb. thrust Allison J71 engines with afterburner at a cost of \$4,800,000. They are not undergoing carrier trials at an all-weather fighter.

These appear to be general aggre-

ments that the basic fault with the F3H-1 design is that the engine selected by the Navy, the J40 produced by Westinghouse Electric Co., cannot satisfactorily handle the aircraft weight.

"Lack of power is not a latent defect, but rather it is one of the first things a jet pilot would observe in testing as aircraft with an unsatisfactory engine. That defect would manifest itself the moment the throttle was opened for takeoff. It is difficult to understand why the Navy would continue to accept delivery of planes with a defect such as this which could not escape observation."

A major point of the congressional investigating committee would whether either senior or mid-level management at McDonnell, the designer, was responsible for the F3H-1's poor performance. McDonnell, however, denied any fault, despite failures in performance tests.

There is some speculation that the failure of the F3H-1 program will in other projects—figured in the recent shakeup of the administration of Bureau of Aeronautics (Navy Sept. 3, p. 12).

F3H-2 Passes Test

The first F3H-2, successor to the F3H-1, was delivered to the Navy, and McDonnell officials say it has successfully passed qualification trials on the aircraft carrier Tremontage.

J. L. Wilk, executive assistant to the general manager of the Wichita Division of Kansas City, which produced the J40s for the McDonnell

Boeing organization

Rep. Kasten, in his letter requesting a congressional investigation said:

McDONNELL'S F3H-1 Navy fighter, congressional target.

F3H-1 presented his congressman's position.

When the F3H program started initially, there were two power plants under development—the J40 and the J42-24. The J42 was the more powerful engine and would have provided sufficient thrust to power the McDonnell fighter.

However, the development of the J42-24 program was canceled by the Navy in September 1953. The J40 power plant being used at the time, the McDonnell engineers knew the J42-22 had always made its specified performance.

Westinghouse officials pointed out that the Douglas X-4D, which was powered with the J42-22, set the world's speed record in 1951.

Navy's Position

The Navy made this formal statement at the hearings.

"With the advent of the Korean campaign in 1950, the Navy found in need of a mid-level, all-weather fighter, more promising than ever before—and in increased quantities."

"As a result, the Navy made an original letter of intent of Oct. 3, 1951, to the McDonnell Aircraft Corp. on trial data as a proposal for the F3H-1 production program. On Aug. 19, 1952, that was converted to a definitive contract for procurement of 150 of this type aircraft. The basic cost of the aircraft, including the power plant, instruments, spare parts and ground handling equipment, did not change during the period of the contract, which ended on Aug. 24, 1954."

"As a result of Board of Inspection and Survey tests at Forest Park conducted on some of the first aircraft produced, it was determined that the power of the engine was insufficient for the weight of the aircraft. The aircraft was considered unsatisfactory for use in training and operations. However, with the incorporation of several weight reductions in the aircraft, the overall weight was considerably reduced, at a cost, based on test data, however, of \$1,000,000. It could not be used as a first line fighter due to the lack of engine power."

"Consequently, with the Board of Inspection and Survey, trials, trials on the contract (McDonnell) was experiencing a series of difficulties in the J40 program, in 1954, some 15 test flights, at St. Louis. The engine had undergone extensive modifications made during the year by Westinghouse, and when the Board of Inspection and Survey recommended several additional experiments to be conducted in the aircraft, it was decided that the extended use of the aircraft did not justify the additional expense and not warrant the operation of the J40 engine as this specific aircraft."

"Consequently, with the Board of

Inspection and Survey, trials, trials on the contract (McDonnell) was experiencing a series of difficulties in the J40 program, in 1954, some 15 test flights, at St. Louis. The engine had undergone extensive modifications made during the year by Westinghouse, and when the Board of Inspection and Survey recommended several additional experiments to be conducted in the aircraft, it was decided that the extended use of the aircraft did not justify the additional expense and not warrant the operation of the J40 engine as this specific aircraft."

Midge Lost in Swiss Try-Out

The Folland Midge crashed during takeoff last week at the beginning of a transatlantic flight for Swiss Army Air and Supply Department delegation consisting of members of the planes' five-man crews.

The Midge, the first to visit the Swiss, was killed when the Midge reached a tree line at the end of the runway. All the plane parts were recovered for an investigation by the Ministry of Civil Aviation. Observers said the plane failed to clear two closely spaced trees as Midge lifted off the ground after "a protracted" takeoff run. Earlier in the day, the Midge had completed two flights with test pilot Squadron Leader E. A. Tremain of the crews.

"At that time, since the need for an all-weather fighter was still great, it was decided to modify the engine, install the J35 engine and call the plane an F3H-2. The F3H-1 production program was interrupted at this point and transferred to the F3H-2 program by the Navy."

At a cost of \$100 of the 350 aircraft originally ordered were converted to F3H-2s.

As regards the F3H-1 aircraft purchased at St. Louis, it has been determined to be feasible to build 125 with the J71 engine. However, the cost of buying the remainder on a standard F3H-2 configuration is considered to be prohibitive, almost equaling the cost of the new F3H-2 models. Installation of another engine is not considered practical nor economical, particularly in these early production aircraft.

"Consequently, the Navy plans to either convert the aircraft to the J71 or to buy another aircraft."

This is a leading vehicle which permits simplicity in beach (beach) and other areas. The beach vehicle will be moved on/offshore near a permanent seaplane hangar. The seaplane hangs between hangar-like structures and then proceeds to its own power up the ramp.

"The beach vehicle is a service and dock deck which will be used for testing and maintenance. This facility will contain padded wing carts which are located beneath the wings and moved forward with the aircraft as it enters the docking area. The dock contains parking facilities, salvaged and a series of landing pads are raised from beneath to secure the aircraft. The facility will have facilities which can raise the deck to service position. Handcrank, electrical and pneumatic power will be provided for servicing and boats will be available for loading or engine change operations."

This equipment will serve as part of the seaplane force which includes repair tool units and maintenance trailers, leaders and maintenance ships.

Economically-Healthy PAL Hopes To Resume Trans-Pacific Flights

Manila—The Philippine Air Lines—economically healthy once again—hopes to resume its now defunct trans-Pacific flights sometime during 1956.

PAL discontinued its trans-Pacific service as an economic move early in 1954—short after the inauguration of Romeo Magasis as president of the Republic.

During the previous administration of President Elpidio Quirino, an overall government budget deficit to the value of \$7,000,000 had been allowed to accumulate. The government is the largest stockholder. With that burden and a total expenditure of only \$6,750,000, PAL found that its credit had become almost non-existent.

Thereupon, company officials advised the new Magasis cabinet that the huge indebtedness would have to be liquidated, or the company would find itself in an untenable position. It had, the officials said, but two alternatives—reduction of that down payment on principal.

When the cabinet decided the government was in no position to put in bid the company—selected in dropping all of its trans-Pacific flights.

Although economy was the most important factor leading to the shut down, other factors contributed to the decision:

- Men's failure to implement its program with the Philippines preventing PAL flight into Mexico City.
- The U.S. government's position to end or grant trans-Pacific flights via Tokyo.
- Reduction of tourist rates on Pacific routes.
- Rapid development of jet-powered and turboprop aircraft, which would make PAL's aircraft obsolete within a short time unless replaced with newer type, which would cost from three to five million dollars each.

Sound Again

It was obvious that such reasoning would have to come from the government but Magasis had been elected on a platform of economy and government leaders felt that an expensive program based upon prestige alone was bound to fail.

Today, however, the company is once again in business. With 80% of its fleet DC 6s and DC-4s rebuilt for \$6,415,971 with grant funds, the company reduced 54% of its capital stock and paid up 75% of its sinking fund obligations to the Rehabilitation and Finance Corporation. With reorganization, the

ratio of the company's assets against liabilities rose from 78.1 to 111.

In the meantime, the government has completed liquidation of indebtedness to the airline, and the company has a healthy surplus.

Company officials are reluctant to discuss their future plans for the trans-Pacific route, but they have not given up completely. However, the officials do admit that they hoped for resumption of trans-Pacific service will depend upon the time being given a government loan facility, promising them the minimum standard rate now paid by all major carriers in the United States.

Under the old agreement, PAL earned the said rate, payment for the service was negotiable in a clause in the loan stating that payment would depend upon "availability of funds." It seemed that the government never had the funds, hence the large indebtedness which finally forced the bid to cancel its trans-Pacific flights.

The company also will be faced with the problem of securing new, complete aircraft for the long flights.

No European Flights

It was learned that the company is not planning to resume its former flights to Europe at this time, although such extension of long range flights is being left open for future consideration.

The company's short range intra-Asian flights to Bangkok and Hongkong were never discontinued.

PAL officials feel that this is an opportunity time to re-enter the long range trans-Pacific flights, since the coming arrival of Convair, which company officials will undoubtedly find a trans-Pacific ear.

Freight Plan Rejected

Aerospace asked for a new plan of its freight service—defended or freight-only lines required by the Civil Aeronautics Board (AVW Sept. 18, p. 18).

The Board, instead, Aerospace's proposed tariff decree because it was lower than the minimum rate set out in the CAB for freight carriers.

Aerospace proposed to maintain after Oct. 1, 1956, a deferred freight service for the first 20 days of each calendar month, and then regular air freight. The new service would be slower than regular air freight service but would be superior to ground transportation time schedules.

Most Philippine politicians believe that the economy lost much in prestige when the international flights to Europe and the United States were canceled and, if the company can present a reasonable financial plan, it probably will be only too glad to put Philippine flag ships back into service.

Domestic Plans

Since dropping its long range international flights the company has concentrated upon its domestic service. A new plan has been drafted calling for a rapid expansion of blocking out fields throughout the length of the archipelago. These fields are being served with C-47 and Convair aircraft, while T-33s are used. Other aircraft are used on feeder lines in some points.

Under this ambitious program PAL hopes to bring aviation into the rural remote areas of the Philippines. Because of the latter's small field capabilities it is estimated that eight fields for the Cessna plane can be constructed and maintained for the cost of one C-47 field.

In Mindanao alone about 15 such fields are now being served by Cessna aircraft. Other other fields have been opened in the remote Visayan islands (Cebu and Bohol), and a few in Luzon.

Advertising Trade Approved by CAB

Civil Airlines Board has added Phoenix Airlines and Trans Pacific Airlines to the list of carriers permitted to trade air transportation for advertising goods and services.

The two Hawaiian carriers are now permitted to join in the practice authorized for the local service airlines last January. The regulation expires Jan. 1.

Under the rule, a carrier must file a full description of any agreement made for an exchange. The maximum amount of transportation allowed under such agreements is \$25,000.

CAB decided to extend the advertising regulation to the Hawaiian carriers in order to help them reduce advertising expenditures and cut their subsidy needs.

UAC Stock Offer

United Aircraft Corp. will offer its stockholders the right to subscribe to about 100,000 additional preference stock on the basis of one share of preference stock for each 25 shares of common stock. The price of the new shares will be determined in the U.S. Board of Directors shortly before the stock warrants offer is made but it will not be less than the per value of \$100 per share.

Butcher's Boys:

Czech Air Force crew and formation of their B-52s (NATO code: Scatter) light bombers which recently participated in a review display at Ruzyně Airport near Prague. Note detail about upper fairings built for entry to bombardier's position and general layout of the position. Pilot's canopy is kept on right side. Assessment appears to be a pair of 23 mm canons, one on each side of the bombardier. Note use of tail gunner position and tail section is not sealed. Communications antenna is oblong type with external wire running from mid aft of cockpit to fin.

Aluminum Expansion Closed to Write-Offs

The primary aluminum expansion goal has been closed for last tax write-offs by the Office of Defense Mobilization.

The ODM action came as aluminum capacity grew the 1955 year to set by the Defense mobilization agency. Total capacity for this year is 1,746,000 tons. Capacity is operation, under construction and planned totals 1,778,000 tons. 37,000 tons more than the goal will be available.

Director of Defense Mobilization Arthur S. Flewelling said that anticipated total capacity appears sufficient to meet current shipping and defense programs as well as needs of the military.

military support facilities and increased national economy as an emergency.

Closing of the aluminum goal will allow earlier ODM action which will open up opportunities for several firms including commercial air transport, pending a review of the various mobility rates goals.

Flewelling said that present aluminum shortages and because of current demand excess demands. He discussed the problem of which he said is already the most difficult of any enterprise.

The 1,778,000 tons of anticipated capacity includes 1,513,000 tons in place, 65,000 tons being built in the Aerospace Division of America, and planned expansion of 54,000 tons by Hawley-Spencer Co., 60,000 tons by Olin Mathison Chemical Corp. and 60,000 tons by Alcoa.

Gavin Named Army R & D Chief

Lt. Gen. James M. Gavin, a strong advocate of Army aviation, has been named Chief of Research and Development for the Army.

Appointed as Gen. Gavin, former Deputy Chief of Staff for Plans and Operations, indicates the strong emphasis Army is giving to the research and development field, Army Secretary Wallace M. Murphy said.

Gen. Gavin will consolidate his activities with those of William H. Martin, recently named as Army's Director of Research and Development.

As the Army counterpart of that office it will report directly to the Army Chief of Staff.

FACTS DETAILS OF THE VICKERS VALIANT, medium bomber now in service with the Royal Air Force, show how radical comprising advanced model of wartime T125 bombing aircraft, visual bombing is done from landing gear down and off the nose. Bombs are held in special fairings at front of fuselage. Behind housing are numbered doors. Circular windows can be raised ports. Large bombs bay additional radio equipment mounted above the defensive panel. Clusters for dropping anti-ship missiles can be seen either side of the engine ports, additional clusters are off the rear tail position. The production Vb. 14, Valiant features underwing, pilot-mounted fuel tanks with self-seals. Povers are short and on upper wing surface only and just outboard of the auxiliary fuel tanks.

Revised Luftwaffe

Growing Pains and Indecision

By Gerald W. Schreder

Bonn—Reiterating delays and legalistic indecision regarding the growing West German air force are becoming increasingly irritating to West defense planners.

The proposed air force, made possible under terms of the German peace treaty, now has about 75,000 apprentices from volunteers. Out of these, probably less than 12,000 will pass the rigid physical examinations and receive enough flight training. And even some of these—available Luftwaffe pilots who will be called upon to form the nucleus of the air force—have not withdrawn their applications to the legal Luftwaffe Parliament and Defense Ministry officials despite a few organizational difficulties. As one defense plan put it, explained to *Aerospace Week*:

"All the Luftwaffe planes upon which we will have to depend in the beginning are now between 50 and 75 years old. And each passing month for they reduce the number of skippies."

A lot of former pilots are suffering their pangs in military offices who have developed physical handicaps that make future service unlikely.

The reasons behind the delays in the actual enrollment of volunteers at hand and a stepped-up program to attract still more are twofold:

* The personnel committee of the

West German Parliament is still pursuing general legislation. For the service of volunteers and the appointment of senior officers.

* The federal cabinet has withheld final decisions on the organizational structure because of Ministry of Defense criticism of certain subordinate units in the upper house to the original government plan.

Meanwhile, the defense planners are working frantically.

Only the initial go/no-light is removed, however, as about 600 volunteers will come running anxious under U.S. Air Force guidance—120 will train for fighter-bomber positions, 400 will become helicopter instructors and 60 will study flight-control methods. Each of these courses will last roughly four months.

After this, the apprentices and volunteers of Luftwaffe status personnel will begin to recruit.

Very little is known—so far has been done about the aerial component of the new Luftwaffe.

Original flight training for 20 wings will start and, under the U.S.-German military aid agreement announced last July, the Germans will receive a number of F-4Fs for their fighter-bomber wings and RF-4Cs for their reconnaissance wings.

With the Germans still reticent, in order, at the very least, up-to-date

fighter planes in service, and not available this year, first or in fact, it won't have enough speed. One Luftwaffe planner was outspoken on this point:

"We are in terrible shape. In the Congress, we demand that we will need a very light, very fast fighter plane. We will need a plane that can reach 100 miles per hour in less than a plane of 1.8 to 2.0 Mach. None of the planes the U.S. is now offering, except under NATO, would fit this bill. The Hawker Hunter, which has been recommended as a possible choice in the fighter field, is not fast enough enough for us either."

Possibilities that a second German aircraft industry might come up with their own plane are discounted here. But Bonn officials admit that a number of U.S. firms have sounded them out on the possibility of cooperation in a new Luftwaffe. Examples of the type would probably begin with the establishment of U.S. maintenance and repair installations. These graduate to some sort of construction with an eye to the future.

Former Lt. Gen. Adolf Galland recently made a detailed investigation of the Folland Gloster in England.

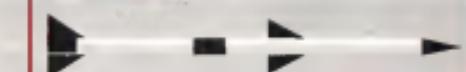

The new Luftwaffe wings will be as well disposed as possible to guard against surprise attack. Each squad will have its own base. There will be no major maintenance and repair bases which will serve all 10 wings. These bases will be as far to the west as is humanly possible. Top Luftwaffe Headquarters will be on probabilities in case of the Defense Ministry on Bonn

Six vital steps to help strengthen national defense

Here are six important steps Burroughs is pursuing all of them. They are vital in making our national defense stronger.

These steps are the complete cycle of defense work. With the extensive and complete facilities of our command, and by working in close cooperation with the Armed Forces, Burroughs is making many important defense contributions. These are in the fields of instrumentation, control systems, communications, magnetic and electronic components and electronic computers. Address inquiries to Burroughs Corporation, Detroit 32, Michigan.

Burroughs

INTEGRATED DEFENSE FACILITIES INCLUDE:
Burroughs Corporation plants in Detroit and Plymouth, Michigan; Burroughs Electronic Instrumentation Division, Indianapolis, Indiana; Burroughs Division of the Zenith Corporation, Philadelphia, New Jersey; Control Instrument Company, Brooklyn, New York; Burroughs Research Center, Paris, France.

Complete Engineering and Construction Facilities

of **CB&I** and **FluIDyne**

Now combined to better serve
the Aircraft Industry...

EXAMPLE: New Supersonic Wind Tunnel for CONVAIR

Chicago Bridge & Iron Company—one of the world's largest steel plate fabricators—is completely equipped and qualified by their association with FluIDyne Engineering Corporation to furnish "turnkey" jobs to the aircraft industry in the design, fabrication and erection of wind tunnels. Through association with FluIDyne Engineering Corporation, Minneapolis, Minnesota, CB&I's engineering staff has now been greatly augmented by FluIDyne's specialized aerodynamic experience.

Headed by J. L. Frazee, formerly with the aeronautical engineering department of the University of Minnesota, FluIDyne operates its own wind tunnel facilities to test and prove new ideas and features in pilot stage.

Thus, full-scale projects such as the new supersonic wind tunnel for Convair can now be designed and built by one company under the sole responsibility of Chicago Bridge & Iron Company. Leader in the field of normalized steel plate structures for over 40 years, and builder of the country's first steel wind tunnel at Langley Field, in 1931.

Write our nearest office for further information.

Above: New wind tunnel under final design build up and later off site of Chicago Bridge & Iron Company's new 200,000 cu. ft. step facility near their Toledo, Ohio, plant. Below: FluIDyne's supersonic wind tunnel at Ames Research Center, operated by the NASA at Moffett Field, Calif., off test bench research valves and boost isolators and mounted by Chicago Bridge & Iron Company.

**First 'Official'
Glance
At Navy P6M**

Morristown Aircraft Corp. last week officially released the first pictures of the Navy's first P6M airplane. Previously the Navy had at least 10 orders for these aircraft despite the fact that previous flights of the Sublette were as display at the National Air Show—an event intended by the military authorities of most lounge audiences. Subsequently, pictures of the plane appeared in Aviation Week (Sept. 18, p. 16). Official pictures show Sublette's piston, swept-wing, four-tail. Hydrofoils are located on both sides of both sternfins. Fuel tanks are located within the wings. P6M has logged more than 21 flight hours since its first flight on July 14. In the meantime, 234 ft. long, 31 ft. high, 10 ft. wide, 10,000 cu. ft. of interior volume, and 1,500 cu. ft. of external fuel tank, 234 sq. ft. total fighter load pilot and George Kofosis, chief of Metcalf experimental flight testing.

NEW and GREAT Prop Feathering Pumps by ADEL

With the decreasing

Two Trainer Builders Join to Form New Firm

Merge of two established aircraft trainer builders was announced last week with the formation of Bortec-Rodgers Training Aircraft, Inc., with plants at Cincinnati, Ohio, and Tulsa, Okla.

The two companies, which have been specializing in design of maintenance training aircraft for the military services and major air lines, are the result of Fred C. Rodgers, since 1934 president of the military division of Stevens Rodgers, and John H. Kieft, former supervisor of training for American Airlines, who founded Technical Training Aircraft in 1949.

Under the merger, the Cincinnati division will continue to specialize in military aircraft contracts, while Kieft's division will continue training panels, while training maintenance and maintenance trainers for the Martin P5M-1 and B-57, Lockheed U-2, B-52 and H-21 helicopters, the B-47, Convair B-58, North American F-86, McDonnell F-4D, Convair F-102 and B-57, and Lockheed R-33V.

Currently the plant is working on an operational trainer for the Pratt & Whitney J57P-10 engine and a precision trainer is to be used for training

No Tests for T-33s

Bethel-lockedheed's T-33 jet trainer has become the first jet trainer produced entirely abroad to be approved for use as a without-plane-by-plane military flight training tool.

The Air Force has decided that only one of every four T-33s needs to be flight tested by USAF pilots. The other three will be accepted as ready for use at the rate of Lockheed's current test program.

Required requirements for test flight will put the T-33s in the same position as the government about 9000 to make place-out of an average flight test.

The new Air Force test standard also provides that the rate may be stepped up to one in eight. If a discrepancy occurs, the testing will revert to one in four for a passing period before returning to one in eight. The ratio could eventually go as high as one in 36 or even one in 12, the company reported.

Douglas DC-3 and DC-7 flight crews will be assigned to land metal train devices for Lockheed, United and Boeing Air Lines, as well as subcontractable manufacturers. The company holds several patents for this type of unit.

CAB Proposes Change In Account Rules

The first major action of regulators governing the preservation of accounts and records in airlines has been proposed in the Civil Aeronautics Board.

In a notice of proposed rulemaking, Part 249 of the Economic Regulation, a decision of Oct. 18 was set for except of certain documents from all material parts.

CAB said that the requirements for adoption of records and the open file panels of releases have been completely revised.

The proposed draft rule seeks to minimize the burden of indexing and storing records. The Board was created by the Airline Tariff and Recovery Committee of the Airlines Finance and Accounting Conference, which made recommendations for updating the present regulations.

NACA Reactor Facility

The National Advisory Committee for Aeronautics will build a 55-1/2-ton nuclear reactor facility at Plum Brook Ordnance Works near Sandusky, Ohio.

Selection of the site was made after

AIRCRAFT

ELECTRICAL

SOCIETY

12th ANNUAL DISPLAY OF

AIRCRAFT ELECTRICAL EQUIPMENT

PAN PACIFIC AUDITORIUM LOS ANGELES

Show Hours:

October 27: 6.00 p.m. thru 11.00 p.m.

October 28: 12.00 noon thru 10.00 p.m.

The Aircraft Electrical Society exhibition is the only one of its kind, and covers entirely, on a National basis, the uses of onboard electrical equipment and its other electrical fields.

This year, the A.E.S. Display will open following the closure of the 1965 Technical Conference on Aircraft Electrical Applications sponsored by the AIEE—Los Angeles.

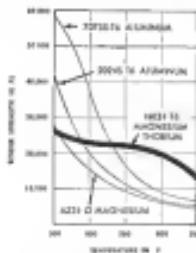

Over 10,000 Engineers will attend this Display.

This year, over 200 National Manufacturers will display their products ranging from miniaturized components to complete airborne generating systems, offering the opportunity to examine and compare the newest equipment design and options...to obtain the latest information on current equipment development.

Invitations free upon request to A.E.S., 920 So. Robertson Blvd., Los Angeles 35

ADMISSION FREE—INVITATION HOLDERS

TENSILE STRENGTH AT ELEVATED TEMPERATURES

Creep Resistance at 300°-700° F.

IN THE DEVELOPMENT of the aircraft aluminum alloys of magnesium they are the only materials which combine creep resistance with good strength and light weight.

For designers of high speed jet planes, aircraft and guided missiles, magnesium is a problem. Frequently it was thought necessary to use heavy materials. They are less cumbersome than these more recent alloys.

Formerly available in the form of castings only, magnesium containing magnesium alloy is now available sheet. BAF's plant produces this sheet.

BAF engineers will help with magnesium in magnesium's most complete facilities for fabrication and assembly. Your inquiry will bring a descriptive booklet.

Brooks & Perkins, Inc.
INDUSTRIAL PLANT
1022 WEST FORT STREET
DETROIT 16, MICH.

Nuclear Development Associates, an independent engineering firm, surveyed 15 possible locations.

The NACA reactor will be built in the study of positions related to aircraft performance. The aircraft performance capabilities of the aircraft flying reactor system for aircraft operation should be "overriding right to an point on the face of the earth and nature." By F. R. Shugard, director of NACA's Lewis Flight Propulsion Laboratory, and W. O. Legge, a group of the great industry, the Atomic Energy Commission, the software service and the NACA in preparing a vigorous sustained attack on the formidable technical problems that need to be solved. The work is to be well into next month on the completion of the complex problems on which the NACA is working.

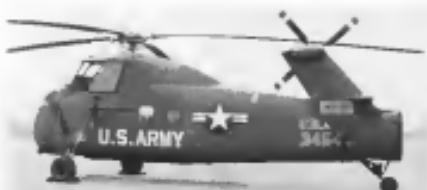

Design of the reactor is being studied to be simplified by the use of the vapor condensation method. Detailed studies can be obtained in the Commandant, AMC Directorate of Procurement and Production, Wright-Patterson AFB, Ohio.

Film Explains USAF Weapons Procurement

A 25-minute film explaining how the U.S. Air Force buys weapons and how the weapons industry can meet a framework for procurement is available from the Air Materiel Command for public and corporate viewing.

The Air Force Procurement Photo Story, "is a 16 mm, sound and color moving picture. It traces the story of U.S. Air Force weapons from its acquisition through the Defense Department, Joint Chiefs of Staff, Air Research and Development Command and AMC to its delivery to the flying command.

The picture is available to contractors and the general public. It can be obtained from the nearest Air Materiel Area office or Air Procurement District. Detailed copies can be obtained in the Commandant, AMC Directorate of Procurement and Production, Wright-Patterson AFB, Ohio.

Folding Tail Saves 10 Ft.

U. S. Army Sikorsky CH-47 with its normal 47 ft. 4 in. height reduced for storage approximately 10 ft. by folding the tail plane forward against the left side of the fuselage. Folded, the plane enjoys the front-line advantage.

This space-saving feature also will be used on the converted S-35 version of the rotor, which the company is offering as a 22-passenger transport with defensive scheduling to start in mid-1956 (AW Sept. 16, p. 142).

With folding point on the right side of the tail section permits the tail to be folded over. Shaft to the tail section disconnects at the top of the fuselage (the circular hole and female gear plug at top of exposed portion of tail section). Disconnecting and folding is done manually.

The Army has 300 CH-47 in the USA, the new chapter weighs 11,657 lbs. and can carry 227 gal. of fuel. Navy has an anti-submarine version designated CH-3, which drops dipping sonar to detect submarine and lightweight homing weapon to destroy them.

FARNHAM SPAR MILLS MEET ALL N.A.S. 912* SPECIFICATIONS

THE ABILITY OF FARNHAM to meet N.A.S. 912 specification is the result of years of processing in the design and development of aircraft parts for the mass production of aircraft and instrument equipment. These years of continual experience, growth, a close cooperation with the aircraft industry has earned Farnham leadership in the design and manufacture of aircraft parts.

A long time ago, the government contract for spar mills of three different kinds of configurations was successfully awarded to Farnham because of their ability to follow up on all those to all details of those rapid specifications.

In the Farnham Long Mill delivered to the Tonawanda Facility of Douglas Aircraft and purchased before it integrated design, revolving on the ways of one base, has been automatic cycling design that consists of 6 million loads. The loads produce three distinct motions: (1) vertical, (2) horizontal and, (3) low rate twist motion. Three spindles are used. Farnham has the largest low rate twist load in the industry and regular reconditioning load cell age is avoided by suspending work.

Though the 300 ft. Farnham Long Mill in Tonawanda is the largest of its kind in the world, it actually uses a low space still, a horizontal mill with belt length, revolving 500 ft. long. The Long Mill requires less handling of work and at a much cost and the rate of working on such less than that of the other mills.

The Farnham reputation has been built on the development and manufacture of specialized spar mills and machine tools in pace with the rapidly changing requirements of the Aircraft Industry.

BRITAIN'S designs are tending not toward engines, such as the Rolls-Royce R.E. 103 above, but . . .

British Aircraft Industry:

Advanced Engines, Obsolescent Planes

By David A. Anderson

London—American engineers predict that British engines would be an obsolescence.

That statement by a British engineer, following a U. S. Senate staff report last year (AVW Aug. 14, p. 12), contrasts the relative status of the aeronautical engineering art in Great Britain and the United States. Like any good engineer, it can be argued against. There are excellent British engines and excellent British aircraft.

But fundamentally, it recognizes that Britain today can offer designers a range of engine types and sizes unparallelled in the United States. It also recognizes that, with the possible exception of English Electric's P.1, there is not a single advanced aircraft being developed in Britain today.

The future prospects for British powerplants, however, never appeared brighter. In stark contrast is the case of aging, substandard aircraft in which these engines are housed.

It's easy to find the reasons for the sorry state of aviation development. The engineering tools are meager in this age of electronic technology. There are no transonic tunnels, no free-air wind tunnels, no supersonic tunnels producing useful data. It's not easy to explain the inferior powerplants, particularly their altitude performance, because these are at

altitude engine test facilities set up and up in Britain. Flying test beds, with their drawbacks of inefficient control mechanisms and difficulty of requiring fast assembly or successive flights, bear all the brunt of aerospace pricing.

Let's ignore these handicaps, the severe British engine manufacturing costs to design, develop, and produce a large number of exceptional powerplants. In no known case is a aircraft development or research flying being held up by unavailable engines.

Assuming, suddenly, that the British have the resources and the courage to abandon their meager aircraft design and engineering, what then are "old" and simple-to-swipe-around British letters from?

Five Engine Firms

In Britain today, five engine firms hold the majority of the transport and turboprop race in production. Each has also a position as aerospace development program supplier at future contracts for military and civil aircraft, here abroad.

• **Aviation Siddeley Motors Ltd.** has developed its Sapphire turboprop to a thrust well above the initial type test rating of 10,200 lb. to the ASBRA. And it has recently conducted reengining of a retired aircraft and features added to permit greater thrust. The case of the Sapphire, although based on steam turbine practice because it was originally designed by Metropolitan

Vickers' engineers, is excellent after prolonged development with blade vibration.

Late models of the Viper, a long-life, but simple and cheap turboprop, are approaching high thrust/weight ratios of about 5.6. Newest type fitted Viper is the ASV 3, rated at 5,750 lb. thrust for a dry weight of less than 460 lb.

The developed ASV 10 gives 2,900 lb. thrust without afterburner, and the ASV 7 B gives 2,600 lb. with one afterburner. Siddeley claims with its latest ASV 10, the engine will be superseded by the British Olympus.

• **Rolls-Royce Ltd.** is a leading supplier to aerospace firms in Britain. It has announced here from the Suder and the Scorpion, but these have long since been supplanted by later designs. • **British Aero Engines** is making a determined drive to become the top engine firm in Britain. Its Olympus engine has been type tested at 10,000 lb. thrust, newer models of the Olympus—the 601 and the DGH 11—are rated considerably higher, with 16,000 lb. thrust as the reported rating to date. Newer engines for the production Vulcan, the Olympus is scheduled to go into the refrigerated firebox in a developed form with higher thrust.

One point worth noting: the Olympus was designed for high-altitude performance. The current world's altitude record of 45,876 ft. is held by the Olympus-powered Concorde. British says the engine has been sold commercially to 70,000 ft.

There are reliable reports of a new British engine called the Zeus with a design thrust starting near the 30,000 lb. mark.

Two small engines at Bristol are the B. E. 25 supercharged turboprop and the lightweight Centaur, designed 1949 Nov. 8, 1951. The B. E. 25 is not yet ready, but is of uncompromising design. Its compressor is a mechanically accelerated and pneumatically variable to that of the Olympus for example. Bristol has named the B. E. 25 as the civil turboprop transport aircraft (AVW Oct. 25, p. 131) as no direct competitor there with Rolls-Royce 319 and Neptune. British future developments:

The Olympus made its first flight in the Folland Gnat last July. Bristol has run up more than 2,600 hours based on the development engine thus far.

The combustion chamber of this engine was designed to 500 hours life at the only stage of the program.

Bristol experts say that the Olympus is in a guaranteed range of 4,350 lb. thrust in the end of this year. The engine qualified in the Gnat now is running at less than 4,600 lb. figure based on current fuel power exhaust.

The Proteus 755 turboprop has been subject of minor redesign, running at the winging off of one British Siddeley Scorpion of gear failure. New helical gears and a new English Electric afterburner for propeller decelerating, characterize the revised engine. The 755 is now type tested at 1,700 shp.

At the end of this year the more powerful Proteus 765 will complete its type test of the expected rating of 2,150 shp. This engine is rated for all British long range models.

Bristol's contribution to missile powerplants are rocket engines. Some years back, the company showed its engine with a single case annular rocket engine, now Mach 3. Engine cycle

• Obsolete . . . Obsolete . . . Obsolete . . . Obsolete . . .

analysis shows that case pressure or cold possible compression pressure rises at about Mach 2.5. It can be assumed that British engineers know this and have developed their projects for Mach 3.0.

The current weight is about 1,500 lb., a figure which should not increase to any great extent in the thrust values claimed. Projects are that the Jason will soon be successful in the highest-known thrust/weight ratio budget approaching a ratio better than 7 to 1. Observers say the engine can then re-

duce DQJ 1, a solid-disk Gamma designed for thrust on the 3,000 to 31,000 lb. bracket. One of these engines is now running on the test stand at the lower end of the design thrust range.

The current weight is about 1,500 lb., a figure which should not increase to any great extent in the thrust values claimed. Projects are that the Jason will soon be successful in the highest-known thrust/weight ratio budget approaching a ratio better than 7 to 1. Observers say the engine can then re-

With the exception of the English Electric P. 1, shown flying, they have failed to produce a single advanced aircraft.

SPECIFY SPERRY

Integrated Instrument System

New system provides simpler, more pictorial cockpit information

MORE FLIGHT DATA, in clearer visual form, in less space . . . this is a modern cockpit need now answered by Sperry instrument specialists. With the Sperry Integrated Instrument System, three new instruments are incorporated into the basic six now in common use, giving the pilot more of the data he needs—simply, obviously, pictorially—without increasing the number of instruments on his panel.

The Sperry Integrated Instrument System consists of a more accurate and reliable primary direction instrument, a combined flight director and gyro-horizon, and a pictorial deviation indicator. Manual control of higher performance intervals—through all phases of VFR and IFR flight plans—can be an orderly, efficient procedure with these panel aids.

NEW THREE IN BASIC SIX

Model C-6 Gyrospur® Computer uses a stabilizer reference with two (Radio Magnetic Indicator) pointers and data transmission for providing accurate bearing information to other equipment. A reliable coarse marker also serves as the bearing selector for the flight director. Model C-6 Gyrospur Computer is also available with integral switch for selecting input to radio pointers.

Model HZ-1 Horizon Flight Director is a pictorial horizon with conventional setting, effectively combined with the well-known Sperry Zero Reader® Flight Director. The non-tumbling horizon is graduated to $\pm 10^\circ$ in pitch from level flight and provides pitch and roll attitude information at all times while

present and future terrain. The Sperry Model A-124 Gyroplot® includes three new panel instruments and is operated from the same remotely mounted, non-tumbling gyro.

Using "zero" on the Flight Director. When not in use the Flight Director pointers can be retracted from view.

Model H-1 Pictorial Deviation Indicator displays aircraft position with respect to ground radio facilities. It includes a new pictorial presentation of the TO and FROM zones of VOR, and an anti-bumping indicator. On ILS, it provides both glide path and localizer deviations.

The System also includes a new lightweight, automated computer for wave enable coupling in all direct manual approaches. The Model Z-4 Flight Director Computer is completely free from the effects of cross-winds and varying pitch attitude resulting from changes in speed and loading.

The Integrated Instrument System is readily adaptable to all types of installations for

radio pointers.

SHADED AREA SHOWS SAVING IN WEIGHT
FOR THE SEVEN PUMP SIZES

use of magnesium-circumferential alloy housing ... more compact use of high-strength cast steel ... and other improvements enabled Vickers to make their line of variable displacement series-type pumps substantially lighter in weight and smaller in size. Yet they have the same high efficiency and outstanding dependability of the previous design.

The improved efficiency of the new Vickers variable weight pumps comes into perspective when it is noted that Vickers' commercial price is a value of up to \$300.00 on each pound of weight saved. Small size means cleaner plunger design, and high overall pump efficiency means less heat generation.

"Improved Design" Vickers pumps have been in regular industry service for more than a year and are available in automatic, pressure compensated, electrohydraulically decentered, flow reversing, and servo control designs. For additional information about these pumps, write for new Bulletin A-3203-A.

ENGINEERS AND BUILDERS OF OIL HYDRAULIC EQUIPMENT SINCE 1921

NEW AUBURN ROCKET ENGINE is not small. Nine inches of thick aluminum in 50 cubic inches, reflecting the economics of optimization.

It is light weight and compact size—comparable to the Viper of 25 with diameter and overall length fit for a wide range of applications. Among these, installation in one of the prototype interceptors now using flight at Edwards Air and Army

Dr. Holloman also is fitting it originally as rocket engine development and one of the first two reverse thrust rocket engines for the Super Sputnik, a missile rocket engine (AW, Sept. 14, '53, p. 62). Clearance for 50 lbs. thrust, the Super Sputnik is a piston, liquid oxygen. A solid carbon brake clears the nozzle into superheated steam and oxygen providing the engine with fuel for thrust. There is enough oxygen in the exhaust to oxidize boron from the plume a mere tenth to be burned in a process parallel to that of the jet engines after burner. Mass and thrust of the Super Sputnik is 1,200 lbs. for 40 sec. thrust.

• Dr. Noyes and See Ltd. is generally regarded as the dark horse in the general race. Based at least one of the top technical schools in the empire business, Noyes established itself as a major threat to its legend by producing the Eldest. Devil and captain of the current post-plant race expected to give birth this 1,000 ship, and that engine in a class with the Board of R. & D. and the Rolls-Royce K.109.

Noyes' engine for Britain has for long been a secret. A special model of the Eldest is slated for Fairey's Rotodyne and will develop 1,150 shp. Two of the engine's Ovys, or generators, are the heart of the floating Rotorcraft P.74 helicopter due for flight testing soon. Final development of the Ovys will rate the engine at 900 hp continuous compared with current rating of 750.

Noyes is one of the seven sources

Ministry of Supply to cancel orders for six Vickers 1,200 hp four-cylinder which the RAF had bought directly off the drawing board.

The RAF was reported to be unhappy with the range, weight and flexibility of the aircraft. Because the V.1200 is the only engine to which the Canadian aircraft is allotted, the engine's future does not look good at the moment. There are some observers in the industry who believe that Rolls has stalled development of the engine until such time as the aircraft picture is more complete.

But regardless, the British aircraft industry is still anxious and noisy in defense and now available in more conventional aircraft.

Other Rolls' developments include elevated paragraphs of the Star type for VTOL applications with at least one test vehicle as designed and soon flight stage.

The close licensing agreement between North American Aviation and Rolls-Royce established the British firm as the future source of large radar en-

gines in its home country. But here again, Rolls-Royce may had stalled with its engine and will have to take off.

Other engine manufacturers aside, Blackburn, subcontracting the Turbostar line of small turbolots under license, and Avro, making the Leonardo and the Leonardo Major for helicopters, remain and utility transports.

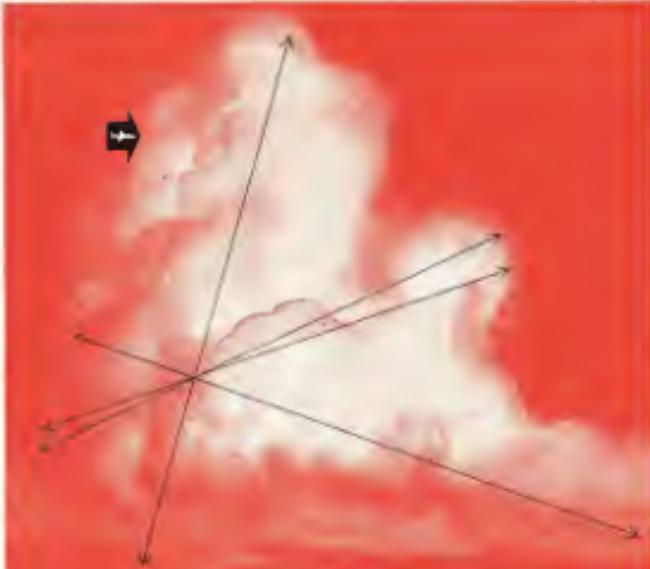

Great Difference

This writer emphasizes the enormous disparity between engine and airframe development. There are more signs that British industry has finally recognized the great gap and is moving to do something about it.

Although the Hover Commission report was published a year ago, it was not until recently that the British government has made any concerted effort to spend much too much. Even with the following elements of the country in better shape than ever before, there is enough not enough money to finance the design and building of a British

* actually set to use for British aircraft in the initial takeoff field.

From check to launching with Benson Lohner's new system.

It is estimated that a total output of 2000 tons has been realized

by using Benson Lohner equipment to reduce data gathered to the

Cloud Physics Project at the University of Georgia. Under the

supervision of Dr. J. S. Pines, numerous inexpensive planes and

such instruments as high-speed cameras, measuring the cloud parameters

related to the areas of clouds and precipitation. The measurements were used to determine the size and density of the cloud droplets and the

size of the precipitation, which provides accurate and reliable records

of cloud droplet sizes and provides accurate and reliable

data for use in engineering projects.

The use of the system has been considered

data processing systems.

NAVY'S NEWEST JET

NEWEST SUPERSONIC FIGHTER, the Navy's Chance Vought XFMU-4, is a slender, sweptwing aircraft designed for air superiority missions in areas of sea operations. Throughout, the XFMU-4 is characterized by its aerodynamic design and simple structure. It was built to take full advantage of the tremendous thrust of its Pratt & Whitney Aircraft J-57 turbojet engine.

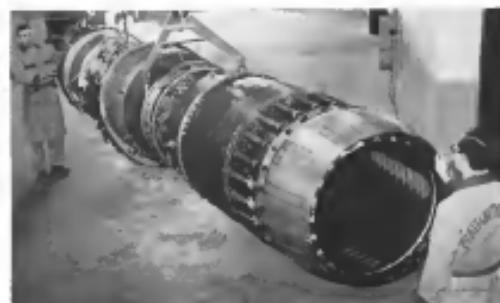

POWERED BY THE J-57

A new supersonic jet fighter, the sleek Chance Vought XFMU-4, is now being test flown for the Navy. Like four other Navy and Air Force fighters, all faster than sound, it is powered by Pratt & Whitney Aircraft's big J-57 turbojet engine.

In the XFMU-4, an efficient J-57 power plant is combined with a trim, lightweight airframe to produce an advanced aircraft capable of supersonic speed, high rate of climb and ex-

ceptional ceiling. Demonstrated fuel economy of the J-57 promises, as well, the long endurance required in carrier operations.

The new Chance Vought aircraft is designed as a carrier-based day fighter, to control the air in areas of sea operations. Again, in this important addition to the Navy's air strength, the Pratt & Whitney Aircraft J-57 turbojet engine continues to make its vital contribution to American Air Power.

AN EFFICIENT J-57 with afterburner, like that shown, develops well over 18,000 pounds of thrust for Chance Vought Aircraft's new XFMU-4. In a trim, lightweight aircraft, the powerful, high-thrust engine provides power to meet specifications for high rate of climb, exceptional ceiling, and supersonic speed.

Strategic Air Command (involved in a
nuclear bomb delivery system), the de-
luge of programs for defense mis-
sions, an energetic prevention effort and
sponsorship of duplicating effort in
lighting and interceptors.

Add to this the fundamental fact
that the Royal Air Force still seems
about getting enough planes to fly the
planes it has, let alone those required
for an expanded fleet. Liquidation is
expected to be random. In Paris
one can't help thinking the average
jet plane's value to the RAF is about
as high as that the self-sacrifice the latter
type of young men that are required for

Pride and Consequence

But pride, perhaps as much as anything else, keeps the British industry
trying to do everything it can.

The British might parallel that
of the French industry a few years after
World War II.

French designers frustrated by long
years of doing nothing, rapidly designed
and built more primitive engines and
airframes than any other country in
Europe or Russia. But in France, unlike
in Britain, success often led to
the production of hundreds of airplanes
with no end in sight as need but to
satify the engineers. The French
industry was picnicing along the lines of
a jet plane, concentrating on types but
sized to the particular problem of
France and her position in NATO.

The Stolz de L'Yvernoisotropic in
Paris and Le Bourget this year was
an eye opener to the visiting British
engineers.

They are themselves losing interest
gained in the French.

The events of NATO's lightplane
contests in Prague, Dresden and the
hot swiveling Hilltop Park Co. were other
bodyblows to British engineering
pride.

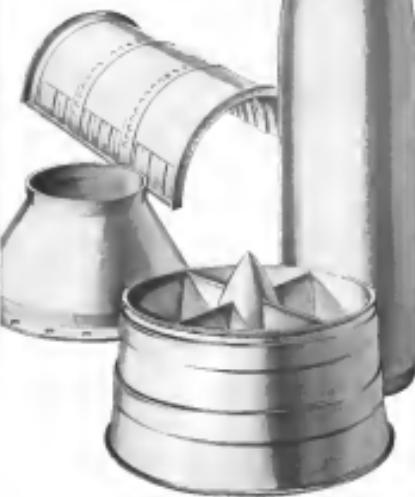

The last year has been the British
aircraft industry's. Starting with the Comet
disaster, a series of released setbacks has
scolded the British aviation industry here
after first.

The important criterion of the British
aircraft industry is not that it is now
producing advanced aircraft but that,
unless something is done quickly, it
will never again produce far after
the rest.

Piasecki Addition

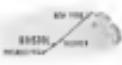

Piasecki Helicopter Corp. leased
9,000 sq. ft. of space near its Morton,
Pa., plant to provide additional facili-
ties for engineering personnel. The
company is moving about 125 engineers
into the new plant, where they will
work on programs for military and
commercial production helicopters.

KAISER
FLEETWINGS

FABRICATOR OF JET ENGINE COMPONENTS

Do you need jet engine components? We have
the engineering ability, the production facilities
and ingenuity, the experience in forming, welding
and machining of high temperature alloys
required to fabricate precision parts. These four
units—compressor casing, bearing air seal, en-
gine duct and core assembly, inner combustion
liner assembly—are good examples of the tough
jobs we like to tackle and do.

A. O. Smith engineers and designs . . .

85,000,000 BTU per hr. cooler

for GAS DYNAMICS FACILITY

Made for each other . . .

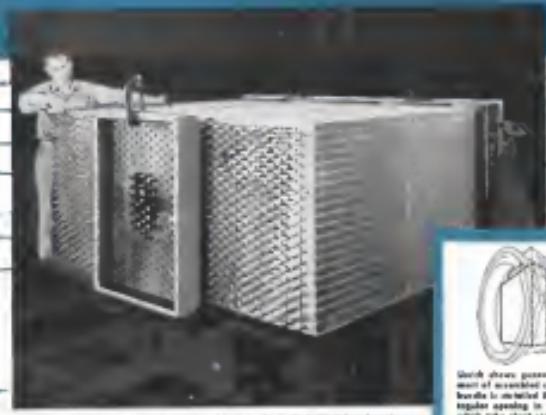

sonic wind tunnel cooler shell and tube

■ A. O. Smith's design in Milwaukee produced the required tube bundle cooler shell and tube bundle for the Gas Dynamics Institute of the Aerodynamic Engineering Development Center at Toulouse, France. The cooler's thermal capacity is approximately 85,000,000 BTU per hr. It's designed for 140 psig on the water side, full vacuum on the air side, and handles as much as 1,800,000 lbs. of air per hr. with inlet temperatures as high as 415° to 455° F.

A. O. Smith offers the outstanding advantages of being able to build a cooler shell of such large capacity and at the same time provide the rigidly supporting tube bundle which it houses. Then, single responsibility for shell design and

manufacture and installation.

SHELL. — The 35-ft. diameter shell, above, is unique and tolerances are so exacting that construction required special manufacturing and tooling equipment for both log shells and heat exchangers. Maximum out-of-round tolerance of weldment is less than-quarter of wall thickness. The ends of the vessel are hemispherical to one within -0° 30'. Clearance between baffles and the tube bundle, when installed, is held to 0.125 in. to prevent air bypass.

Tube bundle for cooler as designed and built in the A. O. Smith Milwaukee plant.

bundle built as a unit by A. O. Smith

TUBE BUNDLE. — Provides approximately 80,000 sq. ft. of outside surface . . . made up of three-quarter in. tubes and aluminum fins — spaced 12 to the inch — mechanically bonded to the tubes. Multiple floating bands of A. O. Smith design assure freedom from thermal stress. . .

F4D, A4D Team Up for Carrier Trials

DOUGLAS F4D-1 SKYRAY (top) expensive fighter fighter, its wings folded with its total stores container, which low over the water for landing aboard U.S. S. *Essex* during its carrier trials. At left, the fighter is seen launching by one of the carrier's main catapults. It has advanced trailing edges of wings (both forward) shown. Note pointed probe under the fuselage which keeps radar beam of the 10,000-ft. short (the F4D-1) target from interfering with radar past the Skyray's tail.

DOUGLAS A4D-1 SKYHAWK (below) comes in for landing aboard *Essex*. Navy pilot in the two Skyhawk shows its nearly past landing characteristics of low speed. Like its F4D twin brother, the Skyhawk has a tailplane extension to reduce interference with airflow past the tail on takeoff.

For
navigation
that can thread a needle
with an airplane...

Call AC

An old Air Force saying: "Hitting a target is easy, but to make a real expert to find one."

AC does both jobs. It finds targets and hits them! The AC Boeing Navigation Company holds a plane on course, supports the kind of navigation that, as one headline puts it, "can thread the needle with an airplane." Bombs kept open . . . radar tracks the target . . . the signal for "bombs away" is given—all automatically, faster and more accurately than the human mind could.

AC has long experience in the field of aircraft navigation. Why not let AC help you with your navigational problems?

AC uses for many applications for qualified engineers in the electronic field. For detailed information, or for illustrated booklet, "AC . . . Engineering for the Future," write to—

AC SPARE PARTS DIVISION - GENERAL MOTORS CORPORATION
FLINT, MICHIGAN • MONTGOMERY, MARYLAND

THE SAME SIZE HORSE from half the motor

PLUS THIS SCREW THAT ROLLS ON BALLS

Replace the common high-sliding-friction screw with an Aramid Ball-Screw mechanism, and you can double drive efficiency. Because this mechanism moves on a friction-less system of steel balls, it eliminates the dead load of friction. This means you can use a 1-horsepower motor where a 2-horse was formerly needed...a 1-horse where 10 was called for, allowing you to save on motor size and weight, fast cost, space and electricity required.

Because Aramid Ball-Screws move mainly on steel balls, they provide two additional advantages. They eliminate the need for lubrication, letting you operate in extremely high temperatures without fear of fire, and in extremely low temperatures without problems of sluggish operation. They make possible fast, precise, continuous positioning down near-zero tolerance.

These Aramid Ball-Screws are at work now on aircraft, on trucks and cars, on machine tools, as standard and special equipment of all kinds.

Aramid Ball-Screws may be able to solve a problem for you. To get more information, write for our free booklet.

Cleveland Pneumatic Tool Company

Established 1873

DEPARTMENT C-3006
BALL-SCREW MECHANISMS • AIR-DRIVE IMPACT HAMMER
AIRCRAFT LANDING GEAR/HANDLING EQUIPMENT

WORLD'S LARGEST MANUFACTURER OF AIRCRAFT LANDING GEAR

Cleveland Pneumatic Products Now at Work on Aircraft

Flight control actuators, used on the Grumman F9F-5P Mock Fighting, consist of a ball screw driven by a 14.875 hydraulic motor, with the motor driven by a 1-H.P. electric motor. Peak operating load is 10,800 lbs.

Ball-screw mechanism 20" long raises and lowers the nose wheel on the Grumman 2234 Mock. Powered by an 18-hp motor, it operates at tension levels of 4200 to 5040 pounds.

Designed to be fire-hazard-reduced from three components, the C-124 Landing gear strut cylinder is a resistance-welded unit. Cleveland Pneumatic's 1,000,000-watt-welded-upset, 4,000,000-watt-expense welding machine.

Hydrogen is readily medium-nitrided, nitrided, liquid-threshold, diffused, impinged—at Cleveland Pneumatic to make this unique landing gear strut cylinder for expanded metal tires.

PRODUCTION BRIEFING

• Armero Steel Corp. has expanded a new sales service department with James G. White at manager, in order to streamline the various service functions of the company's parent sales division.

• Douglas package machining, meeting military specifications or manufactured in a wide range of densities to 30 lbs./cu. ft. Manufactured by Orimo-Cors, using Fibreglas Corp., Toledo, Ohio, the material is designed for the protection of delicate instruments and machinery and other fragile items.

• High pressure, precision die castings in simple or complex shapes for aircraft, commercial and electronic use, are made while from Henni Corp., Los Angeles, Calif. Die castings of aluminum, zinc, magnesium and copper base alloys are available in a full range of sizes and shapes.

• British Oxygen Co. Ltd., London, England, and The Air Liquide Co. of Paris, France, announced the formation of a new company, British Oxygen-Air Liquide Ltd. The new company will operate separately from its parent companies with headquarters in London.

• Associated Manufacturers of Pre-Assembled Joint Materials has been incorporated with executive offices at 520 S. La Salle St., Chicago. Officers are President, J. W. Englehardt; Vice President, Wallace F. Dohle; Secretary-Treasurer, Corp.

• Langley Manufacturing Corp., a subsidiary of the W. L. Marston Corp. has moved their offices to 4737 Amstel Place, Long Island City, N.Y.

• Western Corrosion Corp. has been formed in a subsidiary of Espanco Corp., No. Hollywood, Calif., to manufacture and market protective products. The new company uses Larson hardfacing, wire, hardfacing flux, flux-cored and berolite.

• Consolidated Engineering Corp.'s Stinson Division has moved to larger quarters in Pasadena, Calif. Finsen, only 35 years ago, the Stinson's Division has expanded its engineering staff fivefold.

• National Velveteen Fiber Co., Washington, D.C., has donated an operating board responsible for all management policies of the company with Eugene R. Peir, President, as chairman.

Mountain of mail
greets first call for
product information
for the AVIATION WEEK

Buyers' Guide

Editorial questionnaire brings quick, enthusiastic response from more than 2,700 companies...flood of mail continues.

More than 2,700 aviation manufacturers, suppliers, distributors and service companies, eager to be listed in the AVIATION WEEK BUYERS' GUIDE, built that mountain of mail you see surrounding our Miss DiLorenzo. AVIATION WEEK mailed questionnaires throughout the aviation industry to gather information for Buyers' Guide editorial listings. The response — as you can see — was immediate, enthusiastic, and overwhelming! Many hundreds of companies further documented their enthusiasm for the Buyers' Guide with letters asking for information on specific subjects to be covered . . . editorial departments . . . advertising rates and specifications . . . reservations for extra copies.

Many companies sent complete product catalogs to provide detailed information for editorial listings. More responses pour in every day.

The Aviation Industry's eagerness and enthusiasm for the AVIATION WEEK BUYERS' GUIDE is a sure and certain indication of solid, top-flight advertising value. There is still ample time (forms close = November) for you to take advantage of this matchless advertising opportunity. Call your AVIATION WEEK representative today for full information . . . and be sure to ask him about the Buyers' Guide's special discount rates for catalog-type advertisements.

Try to keep them under 300 words and give a definite identification. We will accept anonymous letters, but names of writers will be withheld on request.

HOW FAR IS BROWN?

Knowing exact height above sea-level is important in navigating military as well as commercial aircraft. The AN/APN-22 radar altimeter, developed by Raytheon and the Bureau of Navigation, gives the pilot this precise information. It is now installed aboard planes of the Army, Navy and Air Force. Compact, reliable, accurate—aviation's new radar altimeter is further evidence of Raytheon's "Excellence in Electronics."

AVIONICS

HAFU flight-in-one indicator displays aircraft heading, pitch and bank angles. Miniature gyros attached to cockpit and hooded switches show bank and pitch angles.

COMPARISON OF THE HAFU indicator (center) with the upper heading/attitude instrument it is designed to replace.

Lear's New Navigation System Simplifies Flying, Reduces Fatigue

By Philip E. Klass

Santa Monica, Calif.—Lear's claim that its new Natural Flight Instrument (NFI) greatly simplifies flight flying and reduces cockpit fatigue is now to accept after only a few months of the controls of a plane equipped with the device.

The new instrument displays aircraft heading and bank angle in a single, much easier environment, in a natural deflected position.

NFI, now in its pre-production evaluation stage, is useful in several important respects:

- Independent pitch and bank indicators. Aircraft pitch angle is shown by a horizontal profile with the side profile of a mountain, plane attached, which rotates about the base of the mountain. Bank angle is displayed as a vertical pointer to which is attached a side view of a mountain plane. Flying is shown on a conventional attitude dial. (See photo, above.)

- Guidance in presentation. Unlike conventional attitude indicators, where the position of the pointer may as if the pilot were the aircraft's heading indicator, consider the pilot to be "the vehicle" and look at his plane's attitude. The pilot maintains his plane to keep the mountain replace profile at the desired attitude.

- Bank angle and heading are superimposed. Since airplane bank angle determines rate of change in heading, Lear believes it should be displayed with heading information, rather than with

pitch angle as in conventional instruments.

It appears entirely possible that Lear may eventually expand its basic NFI by adding servo amplifier and servo actuators, to make it into a combination automatic pilot and flight instrument system.

What Comes Naturally

Flying NFI, according to Lear, can cut much of the pilot's mental work. When the pilot needs to level

out and flatten the mountain plane profile in a climb, there is no question as to question of which way to move the control stick. The same is true when the nose profile on the bank profile shows the plane is in a bank.

Conventional attitude indicators, on the other hand, pose problems, attempting to verify the view which the pilot would see out the cockpit window if he were flying over. However, the evidence that much of the visual feedback information is lost, probably because the horizon presentation is too artificial, solves the small.

Given sufficient environment, flight training pilots can be taught to "visual" the horizon bar (over the stick) in the same direction as the horizon, but then lengthen the training period, according

SYSTEM consists of indicators, stand-alone gyro control unit, power controller and remote control element, if gyro flying is desired. Weight is about 25 lb.

who co-pilots the F-100?

that's a good question—

particularly considering the fact that the F-100 is a single-seat fighter.

The extreme high speed of the F-100 makes things happen pretty fast for the pilot, so a "built-in" co-pilot is

used. In this instance, a vital part of the co-pilot consists of a damping system that immediately and automatically senses and corrects the dithered variation

in the smooth flight path as controlled by the pilot.

STANDARD MINIATURE RATE GYRO

- Sampling rate is as rapid as 1000 Hz with over the air transmission range — in excess of 100 miles
- Motor revolution/24 hr. 400 cycles or 24 with 90°
- Vibration is operational through 10 G's, from 10 cps to 5000 cps
- Acceleration/10 G's along any axis

Options are available for highly classified applications.

Important components of this "flight team" are MINIATURE RATE GYROS produced by American Gyro.

STANDARD MINIATURE RATE GYROS ARE MANUFACTURED AVAILABLE IN PRODUCTION QUANTITIES

Clifton Precision 14 lb.

Developed for the Navy

LONG RANGE SPHERICAL NAVIGATOR

Presents at all times remaining distance to destination, in miles, along the great circle route.

Presents the heading at all times which must be flown to make good a great circle course to the objective.

Continuously indicates ground position during flight.

Indication is continuously corrected for even radical departures from programmed course without impairment of accuracy. When desired, indication can be instantly switched to "base" giving bearing and distance to point of departure instead of destination.

Accuracy (up to 1000 miles) $1\frac{1}{2}\%$ of distance travelled or 5 miles. Ranges available to 1000 and 3000 nautical miles.

SHORT RANGE PLANE NAVIGATOR

Indicates remaining distance to objective and its bearing.

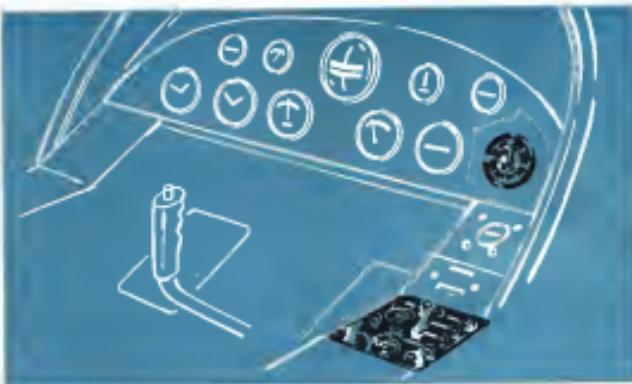

Flight program is on a linear vector basis for short range navigation applications.

Apart from this, the Clifton Precision Plane Navigator incorporates essential features of the Long Range system.

Automatic Navigational Systems

Bureau of Aeronautics

Years of experience in the manufacture of high accuracy synchros have led us to the design and manufacture of lightweight Automatic Dead Reckoning Navigational Systems based on synchro computing elements.

Presentation in both systems is on a Rho-Theta basis for pilot convenience. Both systems transmit XY for automatic plotting table data.

The Long Range system, through solving the spherical problem, obviates errors that amount to as much as 40 to 100 miles and permits continuous automatic correction for magnetic variation.

Dead Reckoning based entirely on information available within the airplane. No need to break radio silence. Acts as a cross check on other navigational data at all times.

TODMORROW'S AIRCRAFT: One step closer

Jet development tames flaming saucers...to squeeze more energy from fuel

Making flame do tricks—like taking the shape of a flat, stationary saucer—is part of the jet engine research at Westinghouse. By passing flame through its pores, engineers learn how to maintain fire in a small space to obtain the most energy...develop smaller, more efficient combustion chambers and afterburners. Specialists meet frequently to discuss combustion problems and draw off at the most productive lines.

This flame research—one of a hundred avenues of aviation gas turbine development—is typical of Westinghouse corporate capability. Metallurgists investigate new heat-treating alloys; casting engineers develop new precision methods; chemical work on new fuels and lubricants.

These projects are just some of the new things going on at the Westinghouse Aviation Gas Turbine Division. They are all part of our program of jet engine development for commercial, military and missile use. All-out research and development is a Westinghouse contribution to aerospace design that is aimed at helping you bring tomorrow's aircraft... One Step Closer.

PHOTO

Basic research in fields allied to jet propulsion is a corporate function—carried on by persons such as this Westinghouse man. Your AGT sales engineer then is backed by the corporate capability of all of Westinghouse as well as specific AGT Division facilities and experience.

Westinghouse

Flying test beds like this Bell airplane are used to test new designs in the sky. Flight testing is the obvious proof of the value of a new design.

These two development engineers are evaluating a new fuel nozzle. The equipment in the background is designed to test the performance of fuel systems.

This is Alvin U. Mischettay, your Aviation Gas Turbine sales engineer in the Dayton, Ohio, area. He is THE MAN WITH THE FACTS. Contact Al or his counterpart in your area for FACTS on Westinghouse and Rolls-Royce engines and designs or write to Westinghouse, P.O. Box 310, Kansas City, Mo.

5 ways fire-resistant SKYDROL lowers cost of airline safety

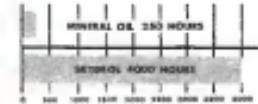

PREVENTS HYDRAULIC FIRES—Catastrophic damage to aircraft can occur in seconds. Skydrol is the only fire-resistant hydraulic fluid. The world's only fire-resistant hydraulic fluid approved by the C.G.A., Skydrol has logged over 4,200 accident-free hours.

1

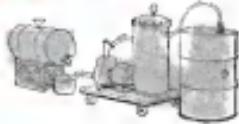

2

LENGTHENS PUMP LIFE—Separate laboratory of Skydrol reduces wear on moving parts. Lengthens service life of pumps up to 54%—cuts component overhaul costs up to 20%.

LONG SERVICE LIFE—Aerospace use in the Douglas supercharger shows excellent chemical and thermal stability; stretches Skydrol fluid service life up to 16 times that of conventional hydraulics oil.

3

4

WONT CORRODE METAL—Skydrol protects metal and alloy parts from corrosion and oxidation.

5

ECONOMY—With a simple, inexpensive filtering process, Skydrol can be used again and again.

35 MAJOR AIRLINES NOW USING SKYDROL

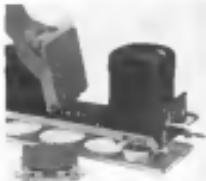

AMERICAN	WESTERN	LAI
BOEING	BOEING AIRLINES	TAI
CONTINENTAL	BATTALION AIRCRAFT	TAI
FLYING TIGER	MATRAIR	LAI
FOKKER	FOKKER	RAF

Where Creative Chemistry Works Wonders for You

PRINTED BY E. I. DU PONT

TRANSISTORS—as switches, as plasma-protected circuit boards, are used throughout Nafis.

by William F. Lewis, who conceived and pushed the Nafis development.

In an aerospace, where every second counts, a pilot can become confused by the readout before his instrument and "locked" impulses, resulting in loss of altitude or incorrect stick movement, Lewis believes.

Proving A Point

To demonstrate the initiative and taste of Nafis, Lewis organized a volunteer flight for a direct comparison. Due to the size of the aircraft, it was decided to choose the Douglas Cessna 172. Lewis' idea was to have passenger seats, putting the plane into a crowding or deicing test. When told to open his eyes, the captain's task is to level out the plane.

In the first trial run, the captain was a conventional, however, untrained, non-pilot. While the Nafis is used in the following trial, (This was not part of the demonstration by AVIATION WEEK), four flights that were trained pilots, went faster and more smoothly. In the Nafis presentation, despite its newness and despite these long years of experience using conventional horizon displays, Lewis says that pilots had the three more "natural" presentation less fatiguing because it gives them more time to respond to cockpit indications.

Easy Turns

Using conventional directional gyro, where most of the compass card is masked except for the top section, Nafis exposes the compass (but not the gradations) of the entire compass card (See photo, p. 94). When the pilot wants to take up a new heading, no mental calculations are needed to determine whether to turn left or right. If the desired heading falls off to the right, just turn off to the compass card, he believes.

The bank angle pointer shows a clockwise direction for the plane is turning. When the desired heading appears under the bank-angle pointer, the pilot merely

55 MILES SOUTHWEST OF NOWHERE—

Some 50 miles south of Cheyenne, in another country, an air-cushioned aircraft needed expert help. The light sky-equipped aircraft had landed in the dusty soil of a small hole and had stuck with a rest on its wings. Helicopter skids was the only means of salvaging the light plane from the loose, bouldered dirt.

Flying a Piascki 35-21 helicopter, the Royal Canadian Air Force went to the rescue. By means of an emergency hoist, the 35-21 hoisted the plane out of the hole and placed it on the air-cushion of its emergency airfield. This is just one more unusual task well done by a Piascki helicopter.

back off on the ailerons to keep the two aligned—and the pilot then comes out smoothly on the dead heading.

The first of 10 pilot prototypes, North reported, has already made a number of flights (a flight deck was used by Kesting & Bates Co. (Grandview Co. of Oklahoma City is making the instruments). An experimental model also is under evaluation for helicopter use by Boeing (AV Sept. 12, p. 34).

Behind The Indicator

The cockpit attitude-indicator indicator (ADI) gets its signals from a remote ATR unit which contains a directional gyro, vertical gyro and associated remote controls. Up to four ADIs (using standard repeaters) can be operated from a single remote glass-enclosed unit to permit dual cockpit and radio installations.

In production evaluation models, the directional gyro has no magnetic slaving; a feature which Len intends to add in production units. This enables the addition of a remote compass trans writer and a slaving amplifier which plugs into the main control chassis. When operated without slaving, the directional gyro drifts one to about four degrees per hour. A small cockpit compass enables the pilot to set in lift track compensation and set up initial heading in the ADI. The complete system weighs about 75 lb.

For the imagination throughout, Len has been able to hold down power consumption. The entire engine assembly weighs 35 lb., of which propeller 17.5, c. 400 rpm power, plus 12 watts of dc, weighs 14 to 25 soft. Total starting power is 900 watts, running power is 195 watts. Production of the low-Nah system is estimated to be three to six units per year.

Avionic Firms Report Sales and Earnings Up

Sustained increased sales and earnings during the first half of 1955 have been reported by several avionics manufacturers. Highlights of these reports follow:

• **Tech Instruments Inc.** announced net earnings for the six months period ending June 30 of 23 cents per share on sales of \$13,941,191 as compared to 20 cents per share on sales of \$11,636,510 for the same period in 1954.

These earnings are below previous fiscal year dividends of \$34,049, paid August 1 on 167,945 shares of preferred stock owned in Mo.

• **Barn Controls Inc.** reported net income in the first half of 1955 to \$10,913 or 61 cents per share, a 7% increase over last year. The com-

Pinwheels for Progress

When Dogwood dashes for the morning paper bus, the postman will be safely bousing around overhead busily dropping his mail in each house's aerial chute.

Swiftness of the express bus will enable the Bursteins and other American families to enjoy rural country living many miles away from the breadwinner's job in the metropolitan and industrial areas.

Today's research in rocket power at RMI is constantly bringing these highly efficient vehicles for private, commercial and military use closer to reality. If you are interested in rocket power applications, write us today.

ducts of

SILASTIC

carry air at 700 F... stay flexible... absorb vibration

Dealing and heating systems demand ductwork that stays resilient and duct will dependably deliver 700 F hot air regardless of constant vibration. Hose made of glass cloth and Silastic*, the Dow Corning silicone rubber, has proved to be the ideal vibration-absorber to install at frequent intervals along straight tubing and at joints and turning points in the ducts.

Silastic stays flexible at temperatures ranging from -100 to +500 F—temperatures far below and

above those required to turn organic rubber into a brittle solid. Silastic withstands ozone, shows relatively little change in hardness after long aging at temperature extremes. Hose of Silastic can be made in practically any cross-sectional shape or size. Silastic keeps its shape and resilience—offers far greater resistance to compression set than any organic rubber.

This application is just one of many ways Silastic is serving the aircraft industry today.

Wherever you need a rubbery resilient that stays rubbery for long, dependable service at opposite extremes of temperature, specify Silastic!

pany made its first public offering of common stock during this period.

Bailey Controls Inc. recently acquired the Ives Co., manufacturer of electro-mechanical switch and testing equipment.

• ElectroData Corp. reports a gross net monthly income, totaling \$675,017, based on the sale of three of the four units of two-generation electronic data processing systems plus revenue from the firm's computing center in Fort Davis.

The company reports its greatest backlog of orders both for complete systems and software equipment. ElectroData expects to ship 12 additional computer systems in the first half of 1955.

• General Controls Co. showed a net profit for the six months period ending June 30 of \$722,496, a 53% increase over the same period in 1954. The earnings on common stock amounted to 86 cents per share compared to 57 cents per share in 1954. In June the company sold 65,000 common shares. Sales for the first half of this year were \$12,399,621, a 48% increase over the same period in 1954.

• Varian Associates reported net earnings of \$101,083 on sales of \$1,791,680 for the quarter ending June 30—75% increase over the previous year. Nine-month earnings of \$382,000 on sales of \$3,018,000 were more than double that of the same period last year, amounting to 78 cents per share. Building, mostly of UHF wave tubes, at June 30 stood at \$15,000,000. Varian stock recently split 10 for 1, was offered to the public for the first time on June 16.

• Aetna, Inc., disclosed in (6)(b)(1) dividends of 75 cents per share on its 100,000 shares. A cash dividend will be payable September 20 to holders of record as of September 3. During last year Aetna sold 99,500 shares of its Class A capital stock.

New Avionic Firms

Formation of several new avionics enterprises, and expansion of several established firms, have been announced recently. These include:

• Frank R. Cook Co., Inc., Denver, as the name of new firm headed by former director of acoustical engineering at Minneapolis-Honeywell. New company already has several avionics projects on deck, including lightweight instrumented communications equipment and an acoustic locator for aircraft.

• North Engineering Co., Grand Rapids, Mich., headed by Mr. John C. Naylor, will specialize in control guidance equipment, explosives. Prior to founding the company, Naylor was employed by Lear, Inc., where he directed the de-

velopment of the first public offering of common stock during this period.

Bailey Controls Inc. recently acquired the Ives Co., manufacturer of electro-mechanical switch and testing equipment.

• ElectroData Corp. reports a gross net monthly income, totaling \$675,017, based on the sale of three of the four units of two-generation electronic data processing systems plus revenue from the firm's computing center in Fort Davis.

called MC BLOCKS can be assembled to provide a variety of digital operation, including arithmetic, logical, storage, memory, memory, and logic devices, at a 1 in. pitch repetition rate. The MC BLOCK consists of 15 pin-grid packages and one wave-shaping clock package. Function performed in each block is determined by plug-in connection cards on printed board. Units are designed for mounting in a standard 39 inch high rack case and require a 7-inch panel height and 9-inch panel width. Computer Control Co., Inc., 92 Broad St., New Haven 37, Conn.

• High-speed, strong tape recorder—capable of reading 30,000 alpha-numeric characters per minute, at 7,000 inches per minute, is a new magnetic tape recorder. The magnetic tape recorder is designed to reduce number of various tapes to less than 100. Device includes its own high-speed magnetic tape head and is able to hold entire printer's copy blank. However, data can be fed to the printer from either punched tape or

LOST
in the shuffle?

Are you drowning in an Engineering Pool? Are you held back by lack of opportunity?

Then consider how much better off you'd be in a medium-sized, progressive organization, one large enough to offer a variety of opportunities, yet small enough that the individual effort can be recognized. Send your resume. Systems needs experienced, qualified engineers to work in the development of new communications systems, surveillance, controls, and other pneumatic accessories for aircraft and industry. Company supported research and development programs are underway leading to the development of new equipment as well as specialized equipment.

Send a detailed resume today to R. T. Borden, and be sure to include your home address. All information kept in strictest confidence, naturally.

Excellent benefits—
—An outstanding

New HIGH INSERTION LOSS NOISE FILTERS

Now Sprague brings you a complete series of precision, high-quality noise filters, ideal for aircraft and mobile radio, television, and electronic equipment at resistances from 0.1 ohms to 100 ohms. For both 200 and 400 cps, with 100-cps bypasses. These filters meet all present MIL and AN requirements for operation at temperatures from -50°C to +60°C. All designs are hermetically sealed with glass-to-metal vacuum techniques.

These filters are available in quantity production schedules from the West and East Coast plants of a reliable, reliable manufacturer. For Engineering Data Sheets and all other information, write to: R. T. Borden, Sprague Electric Company, 12077 Panama St., P.O. Box 6057, Los Angeles 45, California, or 327 Marshall St., North Adams, Massachusetts.

CH. RI. OS I. TY (kyu'or, i. os' i. ti), n.
the desire to learn or know about anything; inquisitiveness.

This is, quite frankly, a bid for inquisitive engineers—creative men who desire to learn more about the future and what it may hold for them.

For at Goodyear Aircraft we have a policy of "progressive curiosity"—a continuous penetrating into new fields, new materials, new methods, new structures—and it has paid off in a host of new advancements important in the progress of missiles, jets, missiles, helicopters, radar, plastics, metals and electronics.

It has paid off because this forceful, creative thinking has attracted engineers really solving the challenge of new concepts.

The challenge at Goodyear Aircraft—and the security that goes with it—can spell a rewarding future for you.

The fields are as broad as the challenge. Goodyear Aircraft is unique in its scope, rock-solid in its stability—contributing importantly in virtually every phase of aeronautics and related fields, backed by the resources of the world's largest rubber company.

Whatever your engineering experience, you see it to yourself to get the facts on Goodyear Aircraft. Write for application form or send your resume to: C. G. Jones, Personnel Department, Goodyear Aircraft Corporation, Akron 15, Ohio. Plants in Akron and Litchfield Park, Arizona.

They're doing big things at

GOODFYEAR AIRCRAFT

THE TEAM TO TEAM WITH IN AERONAUTICS

gives a readback voltage greater than 0.5 volt. Device has an accuracy frequency of 100 Hz to 1000 Hz, with width of 0.04 in. and gap width of 0.003 in. Device is a completely encapsulated design. Inc., 848 Western Ave., Glendale, Calif.

Production-Line Testers

• **Induction tester.** Type K28, for specifying testing of mutual capacitors and inductors by comparison with an external standard, is available with three different selection ranges, providing detection sensitivity up to 25% off full scale. Device can be used to measure 10 nH to 1 microhenry inductors, 10 pF to 1 μF capacitors, and 100 μH to 2 mH inductors with accuracy of 5% of full scale. Federal Telephone and Radio Co., 310 Kingsland Blvd., Instrument Div., Clinton, N.J.

• **Dynamic endplay measurement device.** Model 1015, provides accurate measurement of bearing endplay in predictably physical contact, by means of a magnetic transformer. Device has a sensitivity of 0.00001 to 0.0001 in per division. Manufacturer also makes a small portable dynamic balancer, Model 211, capable of detecting imbalance of high-speed rotary to 0.0001 in. Unit can handle any rotor which can be electrically driven at 16,000 rpm or higher. Order Avi-Bal Corp., 1381 Franklin Ave., Philadelphia, Pa.

• **Electrostatic scanner.** capable of scanning up to 25 production points at the rate of one or two points per sec and, indicates by rate of green lights whether each of the various production points is faulty. Device can be used to measure temperature, flow, pressure, or level. Device is being used in a jet engine plant in which gear box temperature during test is taken. Tadkin Instrumentation Div., Robertshaw-Fulton Controls Co., 2310 No. Fourth St., Philadelphia 33, Pa.

**39553
FILTER CENTER
00010**

► **Spin-Off.** At Hughes Aircraft, the Hughes Aircraft Co. set up its Semiconductor Division as a completely separate operation, to develop its own parent company's higher systems engineering overhead.

► **Outer Communications Tests.** New technique for transmitting UHF and microwave beyond line of sight, called "outer communications" will undergo

evaluation in Laddie Radio under Sepia Corp. sponsorship. Test will be conducted at Avco's Avionics proving ground, Ft. Lauderdale, Avco. Device is setting up a small lab and office at Tucson, to be staffed by about 20 people.

► **New High Frequency Transistor.** An older type of transistor, called the diffusion-base type, appears to hold promise of using transistor operating frequencies up to 500 mc or higher. Some semiconductor experts think the new diffusion-base transistor shows more promise than the high frequency surface-barrier type.

► **Face Mask.** Avantek-General Mills is developing a low-cost version of its Avantek "inhalation" respirator mask under contract at Avco's Avionics proving ground, Ft. Lauderdale, Avco. It is expected to cost \$10,000. New "prior user" Avantek is intended for use by users of respiration and small-respiratory equipment. Printed circuit boards will be mounted internally.

► **Door Evolution.** Avco Avionics is setting up a small Design team at its Ft. Lauderdale Avionics proving ground to evaluate its use as a door and for entry/exit doors, airplane and helicopter. New "prior user" Avantek is intended for use by users of respiration and small-respiratory equipment. Printed circuit boards will be mounted internally.

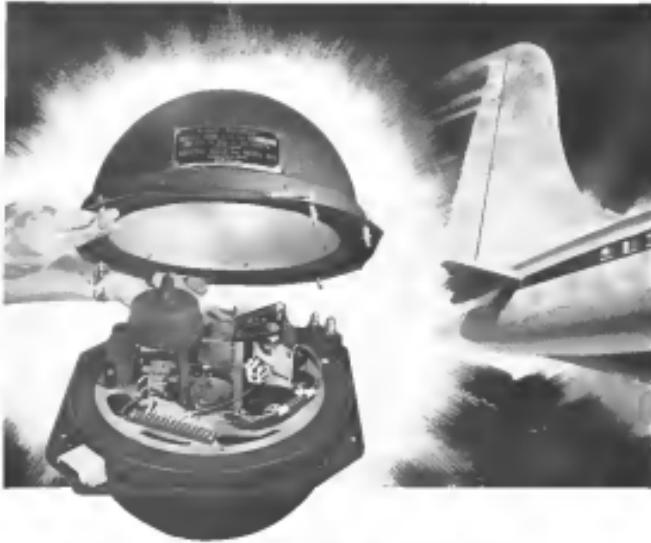

not be a part of the research and development team at Marquardt, one of the nation's leaders in jet propulsion. You are not hampered by restrictions necessarily imposed by larger, more complex organizations... or Marquardt, the sky has no limit! If you're eager to begin creative thinking and doing... if you want to start building the foundations for your career in the sky... then Marquardt is the place for you!

You will enjoy living in climate perfect San Fernando Valley—you will enjoy working with and for people who have their eyes on the stars of the future, where altitudes, speed and accelerations are limited!

General Mills Flight Recorder eliminates expensive plane inspections

Structural inspections that pose to have been unnecessary are a thing of the past! With General Mills Flight Recorders on your planes, you can safely order such inspections only when the Recorder indicates unusual turbulence or extremely hard landings. The Recorder gives you a complete, accurate record of flight conditions. It eliminates ground-work, keeps your planes in the air earning revenue instead of undergoing needless inspections.

The Recorder is light in weight, compact in size, with an electronic circuitry. It is simple to maintain and often assured repeatability.

CHECK THESE FEATURES OF THE GENERAL MILLS FLIGHT RECORDER

□ Records altitude, airspeed, vertical acceleration and direction of flight. □ The basic record is repeated at waveform 2000°F/Sec for a half hour, slows up to 100°F. □ Weighs a clean half that of other commercial recorders measuring the same functions. □ Recorder circuit can operate a maximum of 12 hours. Below ground failure of 1200 ohm resistance-generates reliable results with a maximum of assistance. □ Recorder is a continuous 300-hour recorder on aluminum foil—12" x 30", pressure record that requires no photographic processing or magnetic playback. □ No special record setting package required.

FULL DETAILS on the General Mills Flight Recorder will be gladly sent on request. Write, wire or phone Sales Dept., Mechanical Division of General Mills, 1620 Central Avenue, Minneapolis 13, Minn. 8Sterling 9-8811.

MECHANICAL DIVISION OF General Mills, Inc.

ing to get a Convair team set up in the Los Angeles and New York areas to demonstrate its usefulness at a chapter meeting.

► Helicopter Radar—Office of Naval Research is sponsoring a feasibility study on the use of X-band radar in a helicopter now used at Brooks Field.

► Two TVROs for Kentucky—The Kentucky Department of Aviation has bought a 10- and 15-Watt TVDR and satellite transponder for installation at the Capitol City Airport in Frankfort. A second installation is going in at the Owensboro-Daviess County Air Park.

► New WADC Computer—A new and less dollar electronic differential computer, called the Inertial angle integrated analyzer of its type, is under construction by Revco Instrument Corp. for installation at Wright Air Development Center. The new computer, which will contain over 400 operational amplifiers, will execute WADC's computerized function of a full-field component survey, with 0.01% component in the normal 0.1% field. Radar devices will detect and pinpoint malfunctioning components.

► Pressured Tacan—Reggiani's version of the airborne tacan receiver, under development at Collins Radio, will be made fully operational in production, will be pressurized to permit operation at extremely high altitudes.

► Microwave—Transistor-Bell Telephone Labs reports a new high or low voltage operating frequency with an air pressurized position transducer which has been accelerated at frequencies above 1,000 Hz. The higher frequency causes a 10-fold reduction in the width of the center flange, which maintains less than 0.0001 in. wide.

► Digital Flight Simulation—Watch for the application of digital computer technology to aircraft flight simulation of the future in place of long and arduous computing techniques. Object is to make it easier and quicker to change simulation characteristics to match instrument changes as aircraft aerodynamics.

► Electronic Lens Tone—The Radar Department of Airtex Inc. has announced a new electronic device which makes it possible to quickly evaluate and grade the performance of optical lenses in a quantitative mathematical form. Device will enable users to select specific grade lenses with exact choice freely required for a specific application, RCA says.

There is an important place for you at CONVAIR—FORT WORTH, if you have the qualifications and desire to perform really useful work in these advanced areas.

AERODYNAMICS

Lab and Shop Mechanics of Aircraft and Missiles—
Aerodynamic Loads—Wind Tunnel Testing—
Performance of Aircraft and Missiles—
Flight Control—
Flight Test Data Analysis

AEROPHYSICS

Stability and Control of Aircraft and Missiles—
Analysis of Air Currents—
Atmospheric Measurement Systems—
Systems Engineering—Reliability Selection—
Mobile Guidance, Radar and Worksheets

STRUCTURAL ENGINEERING

Structural and Dynamic Analysis—Materials Research and Development—Preliminary Design—
Kneadability of Steel and Non-Steel Fibers—
Harter Metal Design—Bendulus Computer Programming—
Design Problems

Additional openings also exist in other technical areas.

As a division of General Dynamics Corporation, CONVAIR occupies an important place in the long-range development of the Nation's aerial defense system. The opportunities at CONVAIR are excellent—affording career opportunities for engineers, physicists and scientists—opportunities for professional accomplishment and personal success.

At CONVAIR FORT WORTH are work in flight, air-conditioned maintenance. A company sponsored, unpaid program enables candidates to earn graduate degrees in Engineering. CONVAIR offers liberal travel allowances, paid vacation, modern facilities and retirement programs.

Fort Worth is the Great Southwest. It is a pleasant place to raise a family and to live. The climate is mild, the air is clean, the water is clear. The area has a variety of outdoor activities and is the gateway to the western states of the U.S. and to Mexico. Fort Worth is a place where people really feel like living and other water sports.

Avionics Bulletins

Recently announced bulletins and alerts of interest to the sources in aircraft refueling

• Analog-to-digital converter, high-speed, with 0.1% accuracy. Eight page bulletin includes photos and block diagram. The J. B. Ros Co., Inc., 1725 Chatsworth Blvd., Santa Monica, Calif.

• Mechanical microbalance, with four load cells. For soldering small electronic components. Catalog K-16 by Zipplite Manufacturing Co., Inc., 210 N. Flandy Ave., Ingleside, Calif.

• Recorder, for airborne or ground use, employs new technique in recording digital and sequential data recording.

Up to 212 sec off channels are possible as a four-track unit. Radiation Inc., Melrose, Mass.

• High stability oscillator, glass-enclosed carbon film type, with stability quoted at ±0.1% per year. Ask for PT-1400 Precision Resonator Co., 8 Whippoorwill St., Massapequa, N.Y.

• Frequency counter, a precision capacitance type gauge which can be used to measure surface finish, concentration, particle densities, thickness, and thickness of thin specimens. Catalogue can be obtained by writing to Technical Sales Co. (TM-95) to describe a variety of applications. (28-77) Write to Technical Sales Department, Dr. Robertshaw-Fulton Controls Co., 2210 N. Fourth St., Philadelphia 13, Pa.

• Threaded coil winding machine, portable, for lab or factory use. Device handles wire sizes of AWG 26 to 48 (1/32 in.) Avonil Magnetics Co., 3962 Berlin Drive, Culver City, Calif.

• Magnetic storage element, Type 5911, extremely low-power, high-capacity, and a development for airborne and space use, is fully described in new product catalog. Farno Inc., 500 Commonwealth Ave., Boston, Mass. 02116.

• Four-channel bridge isolator, Type 2110, for coupling strain gauge to direct writing tachographs. Bulletin CED-1950 (1/32 in.) Consolidated Engineering Corp., 500 N. Steven Madsen Villa, Pasadena 13, Calif.

• Regulated dc power supplies, in a choice of 23 output voltages. Ask for Supplement 1A to Catalog 55. Lambda Electronics Corp., 103-82 Northham Road, Cypress, Calif. 90630.

• Micro-manometer, weighing less than 1 oz, as described in four-page CEA-254 available from General Data Int'l Co., Schenectady, N.Y. 12305.

• Minimum pressure gauge, potentiometric, Series C150, weighs 18 oz and can measure 0.001 to 155. Electronics Sales Div., Defaco-Avance Corp., 4511 Northern Blvd., Long Island City 1, N.Y.

Inspection of Superior Aircraft Tubing under 10x magnification.

**Why "Superior" Stainless Hydraulic Tubing
Gives You Above-Specification Quality**

Here are some of the steps Superior takes to make certain that its tubing meets specifications, second to none. We save you time and money by eliminating rework, and that you will get above-specification quality for long trouble-free life.

Even before material is released for production, a macroanalysis is made to check grain size and intergranular precipitation. A chemical analysis is made, and each tube is checked. Strength is checked and corrected for overheat. A hardness examination is made of interior surfaces.

During production, the intermediate annealing heat treating operations are 100% automatically controlled. Cleaning of aircraft quality hydraulic tubing is most important. Therefore a test is

made to check for metallic chips and other foreign particles by running a wire plate through the ID of the finished tubing.

Final inspection involves more than checking for size, straightness, and internal and external imperfections. Tubing is 100% hydrostatically tested as well as flow tested. All parts are inspected under 10x magnification. All tests are performed under strict statistical quality control methods.

If you have problems involving the purchase of high-quality aircraft tubing, Superior can undoubtedly solve it. Write Superior Tube Company, 2640 Germantown Avenue, Norristown, Pennsylvania. Or the West Coast Tube Company, 3710 Southway St., Los Angeles 22, Calif.

RAW MATERIALS: Inspecting, microscopic examination

FINISHED TUBING: 100% hydrostatically tested as well as tested for porosity.

Superior Tube
The big name in small tubing

EQUIPMENT

ASSEMBLED Alenia Reflector Danger Light weight total of three-quarters of a lb.

COMPONENTS of new warning light include aluminum cover, plexiglass double domes, halogen reflector vane and electronic timing circuits

Flashing Signal to Combat Air Collisions

A new type of aircraft light, designed specifically to prevent aerial collisions, has been developed in prototype, built by William Atkins, a Northeast Orient Airlines pilot.

Atkins says that seven companies, including Northeast Orient, have asked him to submit his idea to them.

Given a choice of three different colors, the user has the option of choosing colors to designate type, location which flash at different intervals—three times a second, once a second and once every three seconds.

Lights are grouped, with the fast flashing lamp in front, throwing its beam in an arc 60 deg. to either side of center, the unswitched lights, those in the 60-degree arc to either side of the airplane, and the slow flashing lights over the 120-degree envelope.

Lights may be housed together as a single unit, one or more of which can be mounted on a plane, or there may be mounted independently of one another, in a single housing, independently, whichever they give the best overall coverage.

Master lights, another anti-collision lighting system, was also invented by a pilot and also uses light-emitting diode lights. Developed by Capt. Andrew Mathew, a Transavia Air Lines pilot, that system uses seven lights strung along the top and bottom of a plane's fuselage.

The lights flash in a rapid, off-to-farward sequence to indicate plane's direction of flight. They have been tested in a DC-9 and were recently approved by the Civil Aeronautics Admin.

systems as an anti-collision device for DC-9 aircraft (AVW June 14, 1974, p. 38; Aug. 5, 1974, p. 29).

Collision Course?

The Atkins device gives a pilot an instantaneous and warning indication of

the other plane's direction of flight, Atkins claims. It tells him at a glance whether he is in a collision course with another aircraft and in just how far the minimum amount of time to take evasive action. And the brilliant white light emitted by the lamp stands

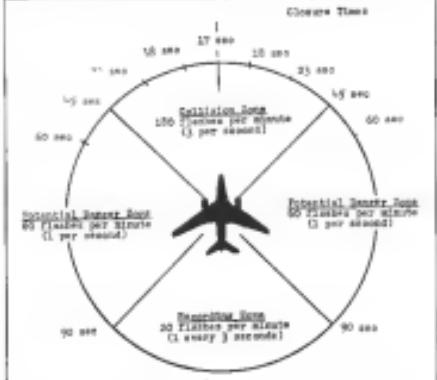

CHART DEPICTS CLOSING TIME for two planes three miles apart flying 300 mph

out in strong contrast from the mass of steady and blinking red lights which clutter both ground and sky around a busy airport at night.

Early recognition of a collision course is becoming increasingly important because of today's fast planes and subsonic jet transports. Transavia's jet transports make rapid recognition even more vital.

Example: If two 300 mph planes are flying a head-on collision course, they will cover the three miles distance in 18 seconds (VFR standard) or 15 seconds (IFR standard). If the planes are going 300 mph, closing time is 15 seconds.

According to Atkins, it takes about three seconds for a pilot to react and use his plane's control surfaces after he has detected what course or to execute. He says that it takes a transport pilot another 12 seconds to deviate from a given course once it's flight controls have been deflected. Thus, the pilot must be able to determine the other plane's course immediately so he can start getting out of the way fast.

An Atkins pilot says "It's vanishing us, and second deciding what to do, it is no longer necessary to take corrective action because you are going to be hitting another immediately and are going to be killed out."

Instant Recognition

Atkins thinks that his system of slow (rapidly-blinking) 150 flights a minute white lights—at bright as searchlight flashes—is a pilot in a collision course to take more time to react and react with more time to react and react with more time to react.

If the pilot sees the plane, 60 flights accurately copied, he will know that the other plane is flying a course about parallel to his. If the plane, 30 instantaneous light shows, he knows there is nothing to worry about, but he can still keep track of the other plane's movement.

Speed of today's aircraft is not the only reason why instant recognition of a collision course is mandatory to prevent an accident.

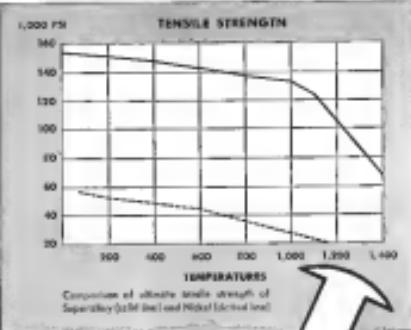

Here is another factor, advanced by Atkins: why a pilot would be paid extra money for a collision course, or some other plane's bearing, is because

If two planes on a collision course are traveling at the same speed and altitude, as observed from the other, all will have no apparent movement and still remain perfectly still in the visual field. Atkins draws the fact that the other plane is flying relatively fast, there is no stimulus in using the pilot's reflexes to spot the imminent accident. The light of the rapidly flashing lights should be the job, according to Atkins.

Here are details of Atkins' lamp and how it works:

The lamp, if built as a single unit,

NOW—FROM DU PONT:

NEW SUPERALLOY AIRCRAFT RIVET RETAINS STRENGTH UP TO 1400°F.

ONE-PIECE FASTENER IDEAL FOR JET, MISSILE APPLICATIONS

You asked for a high-strength rivet able to withstand today's high jet temperatures. Now DuPont has the answer: A 300 Superalloy Rivet. Read the story on page 10. DuPont Rivet can react.

This specially stabilized fastener keeps its high strength—both tensile and shear—at temperatures up to 1400°F. (See graph on tensile strength above.) In fact, Rivets actually increase in strength as they're "cycled," just as they are in jet applications. And, of course, the A-300 Superalloy has all the familiar advantages of a DuPont Rivet: A one-piece fastener with no need to snake lines, it's readily set—up or blind—from the head side only. No breaking bar or after-finishing is necessary.

Superalloy is a metal combination especially designed to resist the loads of suspension. Stably, durable, highly heat- and corrosion-resistant, it is the ideal composition for an aircraft's Rivets. In jet engines, guided missiles or any jet aircraft, the rivet must withstand both heat resistance to temperatures up to 1400°F. DuPont's A-300 Superalloy Aircraft Rivet. To obtain information and specifications on the coming by selected distributor, write: R-1, DuPont de Nemours & Co. (Inc.), Explosives Dept., Wilmington 98, Delaware.

High Strength Superalloy Rivet made from a single piece. A 300 Superalloy Rivet. Reduces the fastener count.

Enjay Butyl—greatest rubber value for electrical application

Enjay Butyl, an amazingly versatile rubber, has opened a whole new field of electrical applications. It has proven itself useful in such varied uses as high voltage coil insulation, wiring and insulation for indoor-outdoor transformers, and insulation for underground service cables. The reasons: its long life, low power factor and dielectric properties, stability to temperature change and resistance to heat and aging combined with its outstanding resistance to ozone and ozone, superior low-temperature flexibility, and resistance to moisture absorption and electrons.

Enjay Butyl is the super-versatile rubber with **indefinite** resistance to aging • abrasion • heat • shaping • stretching • ozone and ozone • chemicals • gases • heat • cold • sunlight • moisture.

ENJAY ENJAY COMPANY INC., 15 West 55th Street, New York 19, N. Y.
Dial 6-6711. 21 South Park Place, Albany 2, N.Y.

35 SUCCESSFUL YEARS OF LEADERSHIP IN SERVING INDUSTRY

resin of an aluminum top cover, a vinylidene Piegels shield body and an aluminum base.

Electrostatic lighting fixtures (there are no moving parts and no switch parts to go) are housed in the upper cap, body and threaded sections at the center body below the Houghay nose doors and instrument panel.

Propane lights, designed to be suspended externally on an aircraft, will measure approximately 5 in. wide, 4 in. high and 14 in. long. Weight will be about 4 lbs. and current draw 100 watts.

Afford says that the duration of the light's flash is 1/1,000 of a second—but fast to cause contraction of the pupil which would result in partial blindness.

He adds that the lamp's brilliant light has almost unlimited visibility on a clear night. During daylight the light can be seen 1000 ft. away, will also 15 ft. even an example of a test during a storm shows where visual visibility was 4 miles, yet the lights could be seen at 10 miles.

While the lights are not the Molam Lights state that the flashes can be easily seen 35 miles at night from the ground, three or four at a range of 17 miles in a light rain and can be seen in broad daylight for several thousand feet.

The Afford studio lights electronic controls have been proved by endurance tests which have run through millions of cycles, the developer said. He points out that the light is in actual operation only a very small fraction of total time.

Bally uses a cold light, similar to that of fluorescent tubes, eliminating heat dissipation problems.

Flits & Head

Afford says that agreement to strike the need for his light.

Now it's time for the few millions to be used to date, because of the relatively small number of planes which is in a very large, air space. As the number of planes increases, the lbs. of probe bulb indicates that many collisions will occur, unless drastic steps are taken to avoid them.

Afford cites these statistics: "Since 1946, there have been 286 major collisions involving cold aircraft. Since 1946, there have been 215 minor collisions."

"Of these collisions, 86% occurred within five miles of an airport and 90% happened at or below 10,000 ft."

"Now, again, the tower provides up to the second information about aircraft movements. Air Traffic Control and radio airport and search lights—all coming to chronic medium schedules, yet here the airport is where the vast majority of

collisions happen. Therefore, motion Afford, "there must be something wrong with the information that present aircraft lighting systems give the pilot."

The active danger light will be manufactured by Aerotech Inc., a Massachusetts concern which specializes in avionic products.

Neoprene Rubber Used In Woven Heating Units

For insulation, thermoflex sleeves, woven units for drawing applications, neoprene rubber is used when moisture

leakage (300°F) is required. The manufacturer reports that flexibility and good resistance to ozone and weather make neoprene the best choice for aircraft insulation, batteries, antennas and cockpit heat shields.

Salvage rubber is used where higher heat is required as it withstands up to a maximum rated that is heatable, non-interceptive and/or resistant.

Over long periods it has excellent stability and flexibility through temperature ranges of from -50 to 300°F, without deterioration.

Salvage Heat Elements, Inc., Middleboro, Mass.

PROGRESS IN DESIGN...

Simplification

Almost a decade ago, Aerotech engineers developed the first series of switches suitable for nearly every precision application in military and commercial aircraft. Some of these switches had as many as 69 parts. Today, due to constant refinement in design, this series has been reduced to a single Aerotech standard switch, and the number of parts has been reduced to 15. And with this reduction has come increased dependability, lower cost, and easier performance. Fewer parts also mean less inventory and overhead and maintenance simplification.

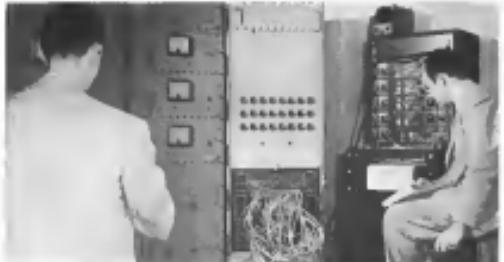

The Universal Pressure Switch is only one example of Aerotech's ability to produce controls that are lighter, more compact, ... controls that will withstand vibration, extreme temperatures, and high altitudes of today's ever-expanding aircraft and missile needs.

When you think of Aerotech's Aircraft Controls, automatically think of Aerotech. There are qualified Aerotech Instrument Specialists ready to serve you. Call or write for Project Engineers Index.

Actuator for Trim Tabs

Lightweight linear direct actuator for trim tab control uses a threaded base on the controller to provide locking for flexible control. Sudden loss of the trim will position 2 or 3 of these travel with 2.56 in. dia. cable. The assembly is designed to provide for a minimum position selection.

Aviation Product Engineering Corp., Route 96, Duxbury, N. J.

Wet Blast for Jet Blades

Automatic pressure wet blast and for finding jet engine compressor blades bonds both sides of the metal surface at the rate of approximately 20 hr removing heat treat scale and discoloration without scale removal or distortion. Unit incorporates a rare facility to remove abrasive compounding after blasting.

Blades are manually bonded or automatically held in holding fixture which grasps the root. A narrow infrared blade in the blaster illuminates when a spray of moving glass whirled by air to destructive velocity accomplish the bonding operation.

Cro-Plate Co., Inc., 747 Waverly St., Hartford, Conn.

Infused virgin resin on one the under parts. To prevent future liquid fail is used. Starting is done using a small high pressure air pressure supply for triggering and the inertia of inertia for lift ignition and control system.

- **Ram air turbine**, Type TBA 190-2, has been designed to provide immediate power supply to aircraft from ground or aerial sources. The turbine ratio is such as to input into the air stream of the windmill. In addition, supply fails but it can be heated within the aircraft, as long as supplied by heating.

Unit operates at speeds up to Mach 3 at sea level. At speeds greater than 320 knots sea level, the top speed control comes into operation.

- **Electro-mechanical trim�� power pack** has a self-contained air supply for the operation of control surfaces in the event of failure of power to the trim�� power source.

• **Rotatable** Javelin offers linear actuator desired in a split field synchronous motor developing 35 hp at 15,000 rpm and 2000 in. lb. of electromagnetic torque to linear

overrun. Unit weighs between 22 and 24 lb. according to the type of coil being used.

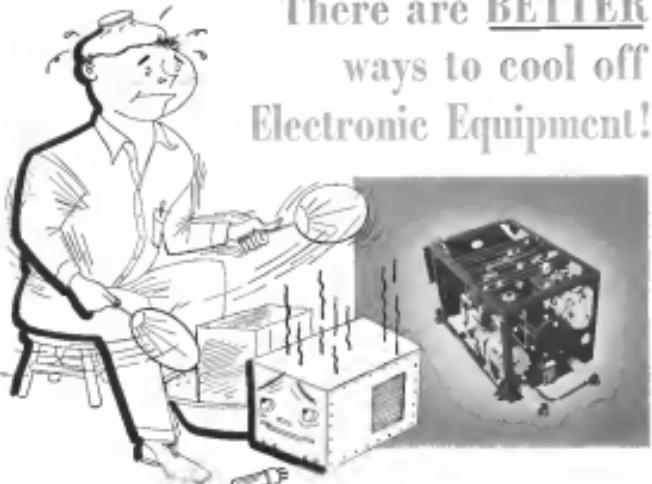

- **Spiral actuator** in a high-torque unit with rates up to 100 in./sec. for fuel tanks, valves and similar equipment. It is driven through an eight-to-one gear ratio powered by a 28:1 dc split field motor source. Output shaft resolution is 1 rpm with a torque rating load 150 lb in. at 1 rpm. Maximum working load 150 lb in. at 1 rpm. Weight 2 lb. 7 oz. and 6 lb. depending.

Pratt International Ltd., Blackpool, Fylde, England.

Generators

Information supplied by a representative of Redstone, Inc., Melbourne, Fla., stated that the company's R1021-6 surface reactor (AW Arg 73, p. 18) included a voice channel. We have since learned by the few that this feature is not included in this product.

AVIATION WEEK

Buyers' Guide

A MCGRAW-HILL PUBLICATION

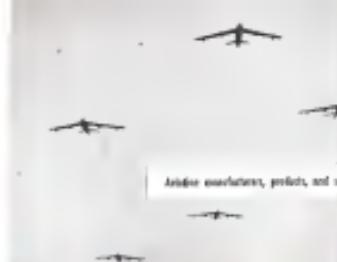

**Brings A Unique,
Long-Needed Publishing Service
to the Aviation Industry**

November 26, 1955, an all-important, needed publishing service will be available to the aviation industry—AVIATION WEEK's Annual BUYERS' GUIDE. The dramatic development of aviation into today's multi-billion dollar giant—reaching now all phases of manufacturing—demands a constant flow of products and materials from one of thousands of separate suppliers—but inside a comprehensive, complete source book of suppliers and manufacturers is a must for all segments of the industry. AVIATION WEEK's BUYERS' GUIDE answers this intelligence need with an information service of peer-reviewed technical, phased directly into the hands of some 17,000 key aviation engineers, management men, design and purchasing personnel—who make up aviation's real buying influence...in the industry itself, in the Air Force, and throughout the Government.

The latest developments in military procurement will be covered in a special report. Included in the detailed information to be presented will be: Air Materiel Command; Air Research and Development Command; procurement, procurement listing—key name, procurement centers, etc.; All-inclusive listings of manufacturers of stratospheric and allied products, manufactured for maximum utility under six major headings: Aircraft, Missiles, Avionics, Supporting Groups, Nuclear Power Systems, Aircraft and Airports. Indexing is set up to provide quick, ready referred-to indexes for all products. In addition, advertisements and product listings will be keyed to each other for ready refer-

ence. AVIATION WEEK's BUYERS' GUIDE also will carry Trade Name and Distributor listings—making this publication the most complete single source of buying information available to the aviation industry today.

Every AVIATION WEEK subscriber will receive the BUYERS' GUIDE. That's a market of some 17,000 key aviation people—plus substantial house circulation through the sale of extra copies of the BUYERS' GUIDE to aviation corporations and government agencies (Price for additional copies is \$3.00 each). AVIATION WEEK's BUYERS' GUIDE will be read, referred to, and depended upon constantly whenever aviation business is transacted.

Be sure your complete line of products and services is listed in this bus book of buying clearance. Special discounts are offered for multiple and catalog-type advertisements. Your AVIATION WEEK representative will gladly help you place your advertising to make the most

economical and resultful use of the GUIDE. Call him today.

* Average net paid circulation, 31,000 (June, 1955 ABC Statement). Paid circulation of current weekly issue more than 31,000. Current weekly print order exceeds 31,000.

a 600° F hydraulic control valve

designed and produced by **Parker**

When airplane speeds passed mach 1 and began pushing closer and closer to mach 3, a high temperature hydraulic valve became vital. To meet this need, a Parker design and production team from the Hydraulics Division developed a 600° F valve that is lightweight, radically new and flexible in design. That valve has been supplied to Republic Aviation and is now available to the rest of the industry.

This new pilot operated valve operates under ambient and fluid temperatures from -65° F to 600° F at 3000 PSI, and it will meet several 600° F valve specifications for weight, leakage, pressure drop, flow rate and speed of operation. The high temperature valve is completely corrosion-resistant steel and has no rubber or synthetic seals to inspect or replace. Parker precision-machined spool and sleeve design insures that operation even at 4000 PSI pressure. Because of these construction features, this control valve requires an absolute minimum of servicing and will normally perform for the life of the airplane.

Let a Parker Team help you

A Parker Team is available to you whether your problem is a 600° F valve, a new requirement in fuel valves or a special check valve. If you have a problem in hydraulics, fuel or check valves or air breathing system design, get a Parker Team on your staff.

Automatic welding head, designed for the Autoweld process, has a single vector drive. New head has a continuous current rating of 600 amp. 500-watt TCV control assembly designed for inert gas shielded oxygen and electric welding. Intensity control is adjustable. It is a combination of a dc welding power source employing constant speed feed. The anode circuit contains a three phase transformer and a rectifier head.

Electro cutting assembly, No. 42 Coaxigraph, features a permanent magnetic solenoid and cuts any shape up to a full 42 in. thick, and straight lines to 92 in.—Air Reduction Sales Co., 60 E. 42 St., New York 17, N. Y.

Moljet Diver is completely automatic, chemically regenerated and compact design for salt or beach removing. Unit provides low cost, dependable diving for compressed gas systems.—Industriol Corp., Roselle Park, N. J.

Merletron remote control consists of a special push-pull cable with a helical outer wrap which provides both to engage holdover which places sheath at a desired to rotate a shaft.—Olfert Inc., P.O. Box 218, North Wales, Pa.

**Douglas Aircraft improves weld quality,
increases production, speeds operator training**

thanks to the ease of operation and simplified control
of P&H Dual-electric Arc Welders

TALK to Douglas Aircraft engineers at Santa Monica about welding their systems of aluminum, magnesium and titanium. They'll tell you that Douglas can out of the welding are at the lowest production. That's why they've switched to P&H Welders for all their aircraft welding and assembly operations.

It's easy to see why Douglas is sold on P&H. It's the only welder that provides positive heat regulation and high frequency oscillators positively feed accurately with an automatic torqueless type of hot control. Because the welder operates immediately to control

without time lag — production is up, spillage is kept

down and operators are easier to train. Douglas likes the reliability and steady operation of P&H Welders — they are available rental and leasing standards to prevent down time and welded disassembly.

They use P&H on your production line and you'll never see anything else. Get full information from your P&H representative, distributor or write to Welding Division, Harnischfeger Corporation, 600 W. Harvard

Denver, Colorado 80204. Warnings: 800

NOW-

MECHANICAL FUEL PROPORTIONERS

Produced by

STRATOS

Stratos Fuel Flow Proportioners[®] offer accurate fuel system dosing in a simple, mechanical method of fuel flow proportioning. Essentially micro-precision positive displacement metering devices, the Stratos Fuel Proportioners can be produced in any desired ratio. Basic applications are:

①

SIMPLE POINT BURNING: Useful for flight or ground refueling. Proportioners dose fuel in proper ratio to any number of tanks, maintaining trim at all times, whether or not tanks are tapped.

②

FUEL SYSTEM SIMPLIFICATION: Gets down on wiring and plumbing—lowers system weight.

③

INCREASED OPERATIONAL RELIABILITY: Able to locate pump in case of fuel tank interior pump failure.

STRATOS

A DIVISION OF FEDERAL ENGINE & AIRPLANE CORP.

AIR TRANSPORT

Eastern Plans \$350 Million Expansion

Rush for U.S. turboprop aircraft gains momentum with order for 40 Electras; jet decision deferred.

The long-predicted rush by U.S. air lines for American turboprop aircraft gained momentum last week as Eastern Air Lines announced plans for a \$350 million jet expansion program designed to meet, if not yet fully, the jet travel era.

Following the earlier lead by American Airlines (AW June 15, p. 12), Eastern's program includes an order for 40 Lockheed Electras at a cost of \$180 million and an option on 40 more. Other plans in the three-stage program announced by EAL board chairman E. V. Reddenbacher:

- Completion of orders totaling \$125 million for convert propeller engines. These makes a total wing. Lockheed's DC-7B fleet is 48 aircrafts and includes 10 Lockheed Super G Constellations.
- Ordering of \$125 million for purchase of 25 turboprop transports. No decision has been announced on which jet transport designs Eastern will buy.
- At the same time, National Airlines and the Pan American Flying Lines placed orders totaling \$74,750,000 for additional 10 propeller engines each.

Primo Flying placed a \$30 million order with Lockheed for 10 L-1049H aircrafts—the largest commercial order for cargo aircraft in aviation history.

National Airlines has bought 400 Metropolitans at a total cost of \$4,250,000.

New Finance Plan

Eastern's financing program formed the largest ever undertaken by an airline, with an estimated total of \$1.5 billion in long-range plan. Eastern experts will set the ultimate pattern for the transition from piston to jet aircraft.

Details of the financing program are incomplete but Reddenbacher said it is a radical departure from the previous practice of using short-term bank loans. It is designed to provide capital as it is needed for the new equipment but delays payment until the aircraft are in service and earning revenue.

"This will give the company a much wider latitude in the use of cash available through the anticipated increased earnings, and from reserves for depreciation," said Reddenbacher.

Together with the much larger capital provided for replacement of long-term capital, this means that the company will be less restricted with

United to Order 25 Jets

United Air Lines will place a \$125 million order for 25 jet transports by the end of this month, according to United president W. A. Patterson.

In a speech in Cleveland, Patterson said his company will buy a jet transport which will carry 122 first class passengers or 400 coach passengers and 6,000 lbs. of cargo. It will have a 4,000-mile range.

Reddenbacher said that Eastern hasn't decided which engine and propeller it will use on the Electra, but it is buying its performance estimates on a 7370 horsepower engine. The Electra's range of greater horsepower will be available to the new Electra's reach to 60, and that performance will be better than present estimates.

After three months of talks, American decided late last month to use the Allison Model 501 turboprop engine for its Electra. Eastern plans to operate its initial Electra fleet on its second- and third-class carriage services on main trunk routes with the Electra, leaving the jetless aircraft for conversion to much wider service. By the end of 1969, the carrier expects research to raise up 70% of its total operating mileage.

Turboprop Problems

In announcing the expansion program, Reddenbacher declared to make the turboprop transport Eastern will buy

CAPTAIN RICHARD B. GROSS, JR. signs Eastern Air Lines' \$350 million contract for 40 Electras at New York meeting with Lockheed President Robert E. Gross.

Southwest Airways First Feeder To Get Permanent Certification

Southwest Airlines is the first local air carrier to win permanent certification under terms of legislation enacted by Congress last spring.

Civil Aviation Board has issued a permanent certificate to Southwest authorizing service to 17 points on a permanent basis and to seven points for a limited period.

The CAB also decided to lift the temporary ban on Southwest's flights to Los Angeles, San Luis Obispo, Santa Barbara and Fresno, Calif., and to allow Southwest to expand short-haul service between San Francisco and Sacramento.

The investigation of the possible merger of Southwest and Transair Air Lines is dismissed in the Board since it doesn't appear that the two carriers can agree on an integration plan.

Traffic Increases Forecast

The domestic scene is fueling action on three fronts concerning Southwest—the Southwest carrier can't wait, the Southwest passengers are flying low, and it is a formal part of the domestic aircraft scene.

In the passenger certificate case, CAB found that Southwest posts meeting the standard for permanent are Los Angeles, Burbank, Concord-Von Mere, Santa Barbara, Santa Maria, Monterey, San Jose, San Luis Obispo, Chico, and

Mountain, Marysville, Santa Rosa, Cleon, Redding, Bakersfield and Crescent City, Calif., and Medford, Ore.

Points certified for a temporary three-year period are San Luis Obispo, Santa Barbara, Fresno, Calif., Bakersfield, Red Bluff, Yreka and Sacramento.

Those points failed to win the CAB standard of five passengers a day.

In the Southwest裁减 case, which was started before passenger certificates legislation was passed, CAB decided several issues not covered in the permanent certificate case.

The carrier must reconsolidate service to Chico at Marysville, Santa Barbara and Bakersfield. United was compensated at those points to help Southwest in its developmental stages. New CAB finds that United should be compensated since passenger certification indicates Southwest has reached an advanced point of development and in view of substantial traffic increases demanded for the three points.

Shuttle Authorized

The Board has decided not to exclude San Bernardino's certificate points where service has never been inaugurated or where service has been suspended for economic reasons.

Southwest is authorized to provide a short-haul service between San Francisco and Sacramento, but will have to make up to encourage development of such short-haul service. The Board doesn't find that competition from Southwest on the route will damage United's similar service.

In reference to a proposed integration of Southwest and Transair, CAB notes that no effective plan has been presented for the merger and finds that a CAB finding on the subject would not serve any useful purpose.

In the domestic aircraft case decision, CAB awarded Southwest a three-year certificate to serve Los Angeles-San Francisco route on T-2000s. Bakersfield, Marysville and San Jose.

Proposed route extensions for Southwest and Transair between Reno and San Francisco and between Las Vegas and Bakersfield are denied, as is a proposal for service by Southwest between Los Angeles and Apple Valley and Bakersfield.

Small Plane Accidents Reach 312 in August

A total of 312 small-plane accidents were reported for August by the Civil Aeronautics Administration. There were 52 fatalities in 35 of the accidents.

Most small-plane accidents involved collisions with ground objects. A tabulation of small-plane accident reports received for August reveals these causes:

Collision with ground object	77
Stall or spin	68
Groundloop	37
Overload	27
Underload	23
Hard landing	20
Nonoperating engine	19
Collision with ground or water	14
Windshield landing	9
Collage or retraction of landing gear	9
Arming failures	2
Other	36
Total	312

North Central Gains

North Central Airlines reports a net profit of \$13,032 in August, bringing the total service carrier net-to-date earnings to \$161,557. Profit for the first eight months totals \$170,000. North Central's revenue totals of \$111,707 in 1974 and compares to a loss of \$32,000 in the same period last year.

North Central carried a total of 40,119 revenue passengers in August for a passenger revenue total of \$569,968. The 475,000 in August passenger traffic and revenue resulted in a 11.9% reduction in federal air passenger tax for the month. North Central reported

CAB ORDERS

GRANTED

Clark Air Lines is given to operate in the Southeast National service area.

Transair, Inc., of Atlanta, Authority to operate in the Atlanta area of the need for an service by Clark Air Lines to Fort Dodge, Iowa.

Transair Air Lines is given to operate in the area involving route of Continental Air Lines San Antonio-Houston route segment.

Transair is given to the ownership of the need for an service by Clark Air Lines between Fresno and Fort Dodge in the Elko area. Department of Administration and the City of Gainesville, Fla.

APPROVED

Agreements between American Airlines, National Airlines and various other carriers relating to intercarrier arrangements.

ORDERED

Providing minimum compensation of the amount of compensation to Air Canada Express, All American Airways, Central American and Pacific Alaska Express forwarded since its proposal has been incorporated in resolution made by previous CAB action.

Northeast Airlines authority to suspend service at the Halifax, Maine, from Sept. 25, to Oct. 30, 1975.

BENEFITED

Stewart Air Service's application for an exemption authority pertaining to its revenue, without prejudice to its renewal at the Long Beach, Calif.

Long Beach Airport, portion of the revenue route of the CAB application which denied protest by opposition of the Texas-California interchange rate.

SHORTLINES

Alaska Coastal Airlines has been reviewed for three years by the Canadian Air Transport for operation as a sole subsidiary charter carrier. The carrier is licensed to operate from Alaska to points in British Columbia and the Yukon. Totals flying assets which have a disposable load of less than 6,000 lbs.

Canadian Transair Inc. of Pointe-Aux-Trembles has been licensed in France with the approval of both British and French authorities. The new carrier will be allowed 170 equipment to carry passengers and 2 vehicles between France and Great Britain.

Toronto, Canada, will have a central air terminal to consolidate separate airline offices scattered through the downtown area. The new terminal will have bus facilities and is convenient to all major hotels.

believe in luck?

To it, just when a man reaches the top before he's forty?

Certainly... if it is considered lucky to have ability, plus the good sense to find a working environment which is right for that ability.

It is that kind of "luck" which has resulted in the development of new management methods that are gradually changing the character of our project management process in the aircraft industry.

You don't need a rabbit's foot to find out what is happening at Martin... and what it might mean for your future.

Manhattan's Heliport Problem

New York needs a downtown helicopter terminal body. This is the missing link that would generate genuine commercial usage from the existing transport helicopter network that already exists within a Westchester, Connecticut and New Jersey.

New York can get a downtown heliport that will be ready for operation within 30 days at a cost of only \$50,000. The Port of New York Authority and all of the leading helicopter operational experts on both sides of the Atlantic agree that this is an excellent solution of the Manhattan heliport problem.

Political Roadblock

The only remaining roadblock is the political opposition of Mr. Vincent O'Connor, New York City Mayor and Aviation Commissioner. Mr. O'Connor is an experienced lawyer but with little knowledge of aviation opposes the Port Authority heliport because he has a project of his own that will cost the taxpayers \$150,000, take considerably longer to build and offer less safety.

All the helicopter experts—the Port Authority and Mr. O'Connor—agree that the last of 30th St. at the Hudson River dock is an ideal location for Manhattan's first downtown commercial heliport. It is close to the West Side express highway, the Pennsylvania Railroad station, subway lines and the Port Office.

The essential difference between the Port Authority's proposal and Mr. O'Connor's, aside from cost, is that the former's heliport would be at ground level while the latter's would be on the 30th-high roof of a marine freight terminal. Helicopter experts who have visited the 30th St. site agree that the ground level heliport offers good safety factors for the helicopter types which are operating during the day and for night because they can maneuver in the 15-20 ft. ground cushion while maneuvering over the river.

The experts include Igne Skrosta, Avant Ventures, developer of Skrosta's successful helicopter airport network; Col. William Becker, pioneer of Army helicopter service; and Robert Courtney, president of New York Airways which operates a transport helicopter service in New York, New Jersey and Connecticut.

Rooftop Safety Loss

Mr. O'Connor's 30th high rooftop heliport would put the helicopter well out of ground cushion for their landing and takeoff operation, causing a substantial safety factor.

Yet Mr. O'Connor has based his entire opposition to the ground level heliport on the ground that it is "unsafe" and that his 30th rooftop port is "much safer."

This is patently absurd. In fact, the reverse is true. The ground level heliport offers a much larger margin of safety with current helicopters than does the rooftop proposal. It will continue to do so until twin engine helicopters with complete single engine performance are developed.

European Heliports

European experience with transport helicopter operations has proved that downtown heliports are absolutely essential for successful commercial operation. Without them, the helicopter loses its best selling point. Brussels, London, Paris, Rotterdam, Cologne, Bonn and Lange all have successful operating downtown commercial heliports.

Manhattan has an huge commuting and traveling population in the several hubs of the transport helicopter network now operated by New York Airways and a growing fleet of corporation owned helicopters used for executive transport. Eventually, Manhattan will need three downtown heliports, the second being located on the East Side and the third at the lower tip of the island.

For \$50,000 the city can begin to get the valuable operating experience that will provide a sound guide for its future heliport expansion. It will also offer to its commuting citizens and the traveling public a new type of transport that is badly needed in the ground bugged traffic congestion of Manhattan.

The experts of the rest of the country also have an interest in this problem. New York Airways is one entity subsidized by the Civil Aeronautics Board through its developmental period. It will be responsible for New York Airways to fully develop its transport network and make its own way without subsidy and without adequate Manhattan heliports. The longer that is delayed the longer the taxpayer must shell out for subsidy.

The problem of the downtown heliport will be one of the biggest problems limiting future expansion of commercial helicopter operations. Without a substantial or extensive transport network loses much of its utility for the traveling public. In Europe, nations have apparently fought the political battle for landing rights in the heart of cities close to local general transportation facilities.

Unless American operation fight and win this battle for the downtown heliport should proceed with regard to economic and safety considerations and not those dictated by politics, they will face a difficult task in giving the people of this country the kind of transport helicopter services they deserve and need.

—Robert Holt

PRECISE 400-CYCLE POWER FOR PRE-FLIGHT CHECKOUT

Here's Leach's new 400-Cycle, 60 kVA portable power package... more than a match for the accuracy demanded by the electrical systems of today's intercontinental aircraft. Despite laboratory-grade precision, it can be whisked right out to the flight line for simultaneous pre-flight checking of two of today's most advanced bombers.

Regulation and control have been raised to a new, high level—the power delivered meets every requirement of today's and tomorrow's avionic systems. Elaborate safety provisions automatically protect both plane and power package from electrical damage.

To learn in detail about the new contribution to flight safety and effectiveness, write today for complete information.

BUILDING BLOCK

Sub-Systems

...in support of the
Weapons System Concept

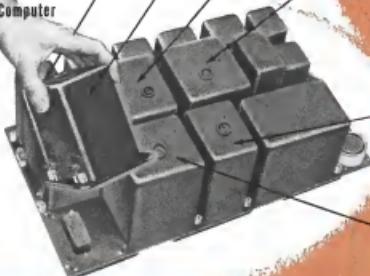

Servomechanisms' philosophy of reducing complex electronic requirements into functionally packaged "building blocks" complements the U.S. Air Force's Weapons System Concept—"Give us a weapon—ready to go!" Our consistent and proven ability to satisfy the exacting demands of today's highly complex military aircraft and missiles have established Servomechanisms as one of the foremost designers and producers of electronic and electromechanical subsystems for flight control and instrumentation. Because of our advanced engineering skills and techniques in reducing complex requirements into "building block" systems, airframe manufacturers know they can rely on Servomechanisms to help them solve their most complicated sub-system problems.

Complete interchangeability and plug-out, plug-in servicing reduces down time to a minimum, insures maximum reliability and helps give the Air Force a weapon—"ready to go!"

Consider the outstanding features of "building block" subsystems when analyzing your overall system requirements, ...specify Servomechanisms, Inc.

The Mechatron Master Data Computer

This typical sub-system provides a single coordinated source for input data required by the various control and instrumentation systems of an aircraft. This equipment is being produced in several versions, tailored to meet the requirements of specific aircraft. The particular arrangement of this equipment is dictated by the requirements of the problem. A wide variety of "building blocks" is available. These proven components are selected and plugged into a common chassis with a minimum of wiring, producing the required data for a particular application.
